No operative facts were stipulated to as to Items 1(a) or 1(c). The evidence reveals, however, that Respondent's "Script for Training Program," (Exhibit C-24), which embodied, in part, its formal respirator

19/ In the Stipulation, the parties agreed to "delete" subsection (c) of Item 1(c). This Stipulation is construed as an unopposed Motion to Vacate, and as such is Granted. (Stipulation, p. 50).

training at pages 3 through 6, directs each employee to conduct his own test to assure the proper fit of his respirator, giving the particulars of such tests. However, this training program does not make it clear to employees, that either they should "routinely" inspect their own respirators before and after each use, or institute a policy under which this "routine" inspection was to be done by supervisory personnel. This "Training Program" was the exclusive formal training given to employees. Employees, (each of whom had a respirator given to him for his own use) did not "routinely" inspect their own respirators before and after each daily use. Further, as Respondent's own foreman witness, Mr. Yuhas (Tr. 1227-1240) testified, occasionally he would casually observe a member of his own crew with a respirator, the straps of which had lost their elasticity, and thus could not be properly or effectively fitted around the man's nose and mouth. He would then put new straps on the respirator for the employee. At the time of the inspection, 50% of the coke oven workers, and approximately 25% of the foremen or supervisors were not wearing their respirators at all times within the area designated by Respondent for such use.

Similarly, because each employee had a respirator assigned to him for his own use by Respondent, these respirators were not routinely collected, cleaned nor disinfected by management. Rather these tasks were delegated to the individual employees, under Respondent's Training Program (Exhibit C-24, pp. 3-6). (Stipulation, p. 49). Calgon lotion soap was available to employees to wash the face piece of the respirators and a disinfecting solution

was available in the foreman's office, located between the two Batteries. However, Respondent's Training Program makes no mention of cleaning or disinfecting respirators, nor were employees otherwise properly trained in this regard. Thus, Respondent's training program is deficient in this regard. Further, the testimony of Mr. Yuhas, formerly a coke oven rank and file employee and since 1973, a foreman, establishes that he, and his crew since 1969, disinfected their respirators approximately eight times a year, less than once a month. The evidence further establishes that during the inspection, the coke oven employees specified in Item 1(c) were not properly wearing their respirators. Thus, the evidence establishes the violations of Item 1(a), (b) and (c) as alleged.

The respirator problems at all coke ovens, including Fairless, is a difficult problem, and so recognized by the Secretary in the preamble to the coke oven Standard (41 F.R. 46773-46775).[20/] Employees find it impossible to wear respirators for the entire eight-hour work shift, because of the high temperatures within which they work, resulting in perspiration and skin rash around the face piece, and the need to communicate with fellow workers while performing their work tasks, impossible when the respirator is in place. Further, the face shields worn to protect against intense

20/ Because of these problems, Section .1029(g)(ii) of the Standard provides that until January 20, 1978, the wearing of respirators shall be at the discretion of each employee where the employee is not in the vicinity of visible emissions. Because the Fairless batteries were in such bad condition, visible emissions existed during the inspection throughout the regulated areas at the batteries. Thus, respirators should have been worn in those areas.

heat (i.e., when coke is pushed, etc.) interfere with respirator use. Thus, the need to institute the engineering controls "at the earliest possible time," that is, to stop or dramatically reduce coke oven emissions from escaping from the ovens into the workers environment, becomes crystallized. Further, the wearing of respirators is to a significant degree, dependent upon the employees understanding of the cancer and other health hazards present, and a certain degree of self-preservation - which translates into worker cooperation with management's efforts to enforce an effective respirator program. The evidence establishes that some, old-time employees, are not convinced of the increased health hazards caused by coke oven emissions (perhaps caused in part by the weakness of Respondent's training program - which is covered infra) or because after many years of coke oven work, they have not contracted cancer. Thus, they are lax about wearing their respirators. At any rate, under these circumstances, and because Respondent's respirator training program, on its face, is deficient as to the subject matter of this Item, a violation is established. The proposed penalty is excessive however, and will be reduced from $1,000 to $500.

SERIOUS CITATION NO. 3 - ITEM NO. 2

This Item charges that persons who cleaned or laundered protective clothing required by the coke oven Standard were not informed of the potentially harmful effects of exposure to coke oven emissions, those "persons" being the families of the Fairless coke oven workers or employees of the laundry who ultimately took over the cleaning duties,

Arrow Uniform Services. Section .1029(h)(2)(vi) of the Standard mandates that such information be provided by coke oven employers.

The Stipulation at pages 51, 51(a) and 51(b) provides the following:

1. During the period from January 20, 1977 to April 2, 1977 some of the employees took their clothing home or to other locations off plant property to launder it.

2. On April 3, 1977, pursuant to contract with Respondent, Arrow Uniform Service, Division of Work-Wear Division laundered coke oven employees' 'protective clothing.'

3. In the purchase order attached hereto, Respondent stated the following concerning the potentially harmful effects of exposure to coke oven emissions:

STANDING ORDER

FOR LAUNDERING AND REPAIR OF SUCH QUANTITIES OF

USS SPEC FLAME RESISTANT PANTS
USS SPEC FLAME RESISTANT JACKETS

SEW ALL HOLES AND PATCH, IF NECESSARY, FROM 1-20-77 TO 2-28-78 OR UNTIL NOTIFICATION OF CANCELLATION BY UNITED STATES STEEL CORP PRIOR TO 2-28-78.

ALL PURCHASES TO BE BILLED AND ITEMIZED INCLUDING THE RELEASE NUMBERS ON THE INVOICE IN TRIPLICATE, ON THE 25TH OF EACH MONTH.

'VENDOR, AS AN INDEPENDENT CONTRACTOR, SHALL PROVIDE ALL SUPERVISION, LABOR, TOOLS, EQUIP., MATERIALS AND SUPPLIES, AND DO AND PERFORM ALL WORK AND/OR SERVICES NECESSARY FOR THE IN-PLANT PICKUP, HANDLING, LAUNDERING, REPAIR AND RETURN OF PROTECTIVE CLOTHING USED BY PURCHASER'S EMPLOYEES AS BELOW PROVIDED.'

THIS ORDER IS NOTIFICATION TO VENDOR THAT THE PROTECTIVE CLOTHING TO BE LAUNDERED HAS BEEN USED IN REGULATED AREAS OF U.S. STEEL'S COKE OVEN OPERATIONS AND IS DESIGNATED CONTAMINATED FROM EXPOSURE TO COKE OVEN EMISSIONS AND MAY CAUSE POTENTIALLY HARMFUL EFFECTS SUCH AS DESCRIBED IN THE OSHA STANDARD COVERING COKE OVEN EMISSIONS (29 CFR #1910.1029), EFFECTIVE JANUARY 20, 1977.

EACH EMPLOYEE'S PROTECTIVE CLOTHING SHALL BE REMOVED AND CLEANED NO LESS FREQUENTLY THAN ONCE WEEKLY. USED CLOTHING FOR PICKUP AND LAUNDERING WILL BE CONTAINED IN SEPARATE CLOSED CONTAINERS SUCH AS SEALED PLASTIC BAGS. ALL PRECAUTIONARY AND IDENTIFYING MARKS AND LABELS ON SUCH CLOTHING AND CONTAINERS RESPECTING EMPLOYEE NAME, HANDLING AND EXPOSURE OF SUCH CLOTHING TO COKE OVEN EMISSIONS SHALL BE RETAINED. VENDOR SHALL BE SOLELY RESPONSIBLE FOR THE PROPER CARE, HANDLING AND LAUNDERING OF SUCH PROTECTIVE CLOTHING AND RETURN OF THE SAME TO USS IN FULL COMPLIANCE WITH ALL CONDITIONS HEREOF AND LAWS AND REGULATIONS APPLICABLE THERETO.

VENDOR SHALL ALSO GIVE ITS EMPLOYEES NOTICE OF THE NATURE OF THE EXPOSURE OF THE CLOTHING COVERED BY THIS ORDER.

ALL PERMANENT FLAME-RESISTANT CLOTHING SHALL BE CLEANED IN A MANNER SO THAT FLAME-RESISTANT PROPERTIES ARE MAINTAINED AND NECESSARY REPAIRS MADE IN ORDER TO INSURE EFFECTIVENESS OF SUCH GARMENT. ALL PANTS AND JACKETS WILL BE IDENTIFIED WITH EMPLOYEE NAME.

The evidence establishes that Respondent's employees were not advised by management, prior to April 3, 1977, of the potentially harmful effects of handling outside work clothes, soiled with coke oven emissions. At about this date, Respondent contracted with the Arrow Uniform Services, a large commercial laundry firm located in Philadelphia, to pick up the employees outside work clothes,

clean and repair them, and deliver them back to the work site. Between January and April, 1977 - (and perhaps for years prior thereto), it was the practice of the coke oven employees to take their outside work garments home with them to be laundered.

The potentially harmful effects of handling coke oven soiled garments is either skin cancer - (not a well documented hazard - as yet by the scientific community) and inhalation of dust if the clothing is handled to any degree before laundering or cleaning with the resultant increased hazards of lung and other forms of cancer and other pulmonary illnesses.

Because the employees were not warned of these hazards, they in turn could not alert their wives to these potential hazards.

Two questions are posed by this Item. First, is the "notification" set forth in the purchase order to the Arrow laundry an adequate notification of the "potentially harmful effects of exposure to coke oven emissions?"

Second, were the employees adequately notified? The answer to both is no.

The fourth paragraph in the purchase order set out in the Stipulation - the "notification to the vendor," absent a creditable showing of telling the vendor <u>what</u> the potentially harmful effects are, is inadequate on its face. There is no creditable showing in the evidence that Respondent did tell the Arrow Company that the chance of skin cancer, although slight and not well documented, is present in handling coke oven soiled clothing as well as an increased risk of lung and genito-urinary cancer and other lung ailments in such handling.

Respondent argues in brief that the preamble to the Standard, 41 F.R. 46747-48 declares that, "... there is no clearly demonstrated excess mortality[21/] from skin cancer in U. S. Coke oven workers. However, from epidemiological surveys of British coke workers and similar studies involving employees in related processes in the United States and other countries, the possibility of a skin cancer hazard cannot be dismissed."

Further, the preamble provides, at page 46781, that, "The word 'cancer' is not required to appear on the label (to be affixed to bags of coke oven soiled clothes) because in these circumstances, we believe it would be unduly alarming. On the other hand, * * * OSHA believes it is appropriate that individuals who are engaged in handling and laundering the contaminated clothing be apprised of the hazard and practices to be avoided when handling the clothing."

Thus, Respondent argues, the purchase order statement to the Arrow laundry is more than sufficient. This argument is not persuasive.

Although the Standard does not mandate that the word "cancer" appear on laundry labels, obviously this cancer risk information should be conveyed to persons handling such work. Otherwise, the cited provision of the Standard is not only meaningless, but a rather cruel exercise in double talk, an exercise I decline to attribute to the Secretary in the coke oven Standard.

---

21/ The preamble also points out that skin cancer is easily treated and death therefrom is not the usual course of this condition.

Lastly, Respondent agrues that any provision of the Standard which goes beyond an employee, is jurisdictionally beyond the provisions of the Act and not authorized thereunder.[22/]

This argument is also not persuasive. Respondent is obligated to inform its employees of the hazards in handling soiled coke oven work clothes. This was not done in this case according to the evidence. (See Exhibits C-24 and R-11, two versions of Respondent's "Training Program," and C-25 its "Compliance Program"). If the employees had been so warned - then the employees, if they were do disposed, could have warned their wives and thus protected them, and their children from exposure.[23/] Further, there is no evidence that some of the employees might launder their own clothes, a practice not unknown in America.

Clearly the Arrow laundry was a subcontractor of Respondent, and because Respondent's coke ovens created the potential hazards, Respondent is obligated to at least inform the subcontractor of these potential hazards. Indeed, the wives of the coke oven employees, washing the coke oven emission clothing prior to instituting the commercial laundry service, stood in the same position as the

---

22/ An argument evidently not advanced to the United States Third Circuit Court of Appeals which was asked to review the legal validity of the Coke Oven Standard. See the AISI case decision cited supra.

23/ There is no showing in this record, that the Fairless coke oven employees had such lack of concern for their wives and children, that they would not pass on warnings to them - or at least advise them to exercise great caution.

Arrow laundry later occupied. Thus, Respondent, at a bare minimum, owed to its own coke oven employees, a warning of the potential hazard. It gave none.

The evidence establishes the violation as alleged.

SERIOUS CITATION NO. 3 - ITEM NO. 3

This Item charges that Respondent did not provide lunchroom facilities, i.e., its "old" lunchroom, with temperature controlled, positive pressure and filtered air, readily accessible to employees working in the regulated area, as mandated by Section .1029(i)(3) of the Standard.

The Stipulation establishes that the "old" lunchroom was located in the regulated area between Batteries No. 1 and No. 2 at the bench level. It did not have temperature controlled, positive pressure and filtered air at the time of the inspection.

Respondent defends this violation on the grounds that it was impossible to so equip the "old" lunchroom because it was in such poor condition that it was beyond rehabilitation. Thus, in December, 1976, a decision was reached to construct a "new" lunchroom, i.e., to convert a then existing building, located at bench level, 15 feet away from the "old" lunchroom, by putting a new roof on this structure and moving a preexisting partition, providing a lunchroom 13' x 45' with about a 9' high ceiling. From the time this decision was reached, in December, 1976, to the date that Respondent's witness, Mr. Orloski (a drafting engineer having some responsibility in implementing the "new" lunchroom facility) testified, May 25, 1978, there ensued a torturous course of drawings, contract proposals,

bids, work orders, changes in design and delays, with the net result, that the "new" lunchroom, as of this 1978 date, still was not equipped with the environmental controls mandated by the Standard. (Tr. 1390-1415; 1421-1441; 1442-1452; Exhibit R-10). Respondent obviously did not consider this employee protective devise something which should have been expedited and clearly did not expedite this matter. One method Respondent might have used to expedite the implementation of an environmentally controlled lunchroom at Fairless, was to have Mr. Orloski go to U. S. Steel's Fairfield, Alabama, Gary, Indiana or Clairton, Pennsylvania, coke works and observe such lunchrooms which had been installed at those sites - or perhaps - call for copies of plans and specifications those facilities had developed in providing this type of lunchroom - and thus reduce the inordinate length of time taken at Fairless in supplying its workers with an adequately equipped lunchroom. These steps were never taken.

Thus, the evidence clearly establishes the absence of an environmentally controlled lunchroom (either "old" or "new") available to Respondnet's coke oven employees at the time of the inspection (and as late as May, 1978). Thus the violation as alleged is established.

However, the proposed penalty of $1,000 is excessive, because the failure to provide this facility was in part at least caused by the failure of the subcontractor (Busch) to supply the air conditioning-heating units as agreed. Some delay was understandable because in February, 1977, Mr. Orloski changed the design requirements

for the three ton capacity unit from a steam heat coil to an electrically heated coil. Thereafter, however, Respondent did little to force the subcontractor to expedite delivery other than to telephone and obtain new, ever lengthening delivery dates. Under these circumstances, a penalty of $500 is appropriate.

SERIOUS CITATION NO. 3 - ITEMS NO. 4 AND 5

On the final day of trial, May 26, 1978, Respondent in effect moved to withdraw its notice of contest as to these violations, but not as to the $1,000 penalty proposed for each Item. (Tr. 1649). Respondent's oral motion is hereby granted and the violations as alleged are affirmed.

There remains the question of appropriate penalties. Item 4 charges that coke oven employees on both batteries did not wash their hands and faces prior to eating, a "Hygiene" practice mandated by Section .1029(i)(4)(i) of the Standard. This Section mandates that employers "shall assure" that employees follow this hygiene practice, which, the evidence reveals, and the record establishes, Respondent failed to do.

Respondent's "Training Program", Exhibit C-24 at page 11 states as follows:

* * *

> After being in a regulated area, the regulations require washing hands and face before eating or drinking anything or using any tobacco product or chewing gum. Washing facilities in areas in or near lunchrooms, change rooms, shower rooms, etc. must be used to wash hands and face before eating or drinking anything except drinking water.

However, there is no showing in the record that Respondent enforced this training directive, and all employees did not follow it, including at least one of Respondent's foremen, Mr. Lepionka (Tr. 796, 812-814). One reason revealed in the record, why this hygiene practice was not followed, is that at certain times, no hot water was available with which to wash, a disincentive during cold winter months (Tr. 816-818).

The proposed penalty is appropriate.

Item No. 5 charges that Respondent did not assure that employees did not consume food or beverages or smoking products in the regulated areas - i.e., the topside of both Batteries - and the substandard "old" lunchroom, as mandated by Section .1029(i)(5)(i) of the Standard.

The Stipulation establishes that employees were observed during the inspection eating and smoking in the "old" lunchroom, in the regulated area - which was not environmentally controlled. Further, the evidence reveals that eating and smoking took place "anywhere" the employees decided was appropriate.

Although Respondent's "Training Program", Exhibit C-24, at page 10, lists prohibitions that the "regulations" i.e., the Standard mandated about eating and drinking, there is no showing in this record that these prohibitions were enforced by Fairless management.

The proposed penalty is appropriate.

SERIOUS CITATION NO. 3 - ITEM NO. 6(b) AND (c)[24]

Section .1029(f)(7) of the Standard provides as follows:

[24] Item 6(a) was deleted in an amended Citation dated October 3, 1977.

> (7) Training in compliance procedures. The employer shall incorporate all written procedures and schedules required under this paragraph (f) in the information and training program required under paragraph (k) of this section and, where appropriate, post in the regulated area.

Item 6(b) alleges a failure to incorporate in Respondent's Training Program, all written procedures and schedules mandated by Section .1029(f) of the Standard.

Section .1029(k)(1)(iv)(d) of the Standard mandates that Training Programs include, inter alia,

> (d) A review of all written procedures and schedules required under paragraph (f) of ...

the Standard. Item 6(c) alleges Respondent's Training Program did not have provision for such a review, specifying six deficient areas.

The Stipulation, at pages 57-59, quotes pages 17, 18 and 19 of Respondent's Training Program, Exhibit C-24, initially issued on January 7, 1977 and revised on January 14, 1977.

A comparison of Respondent's Training Program, with Section .1029(f) of the Standard, reveals that the Training Program does not include all written procedures regarding work practice controls as follows:

.1029(f)(3)(i)(a)(1) - Prompt and effective repair or replacement of all engineering controls.

(a)(2) - Inspection and cleaning of goosenecks and standpipes prior to each charge etc. -

(a)(5) - Inspection of steam nozzles and liquor sprays prior to each charge etc. -

(a)(7) - Inspection of charging holes and lids - prior to each charge etc. -

.1029(f)(3)(i)(b)(1) - Proper filling of larry cars.

(b)(2) - Proper alignment of larry car oven charging holes.

(b)(3) - The charging of the oven following seven specified steps.

.1029(f)(3)(ii)(b) - Regarding the coking cycle - the repair, replacement and adjustment of oven doors, chuck doors and oven doors and door jambs to provide a continuous metal-to-metal fit.

.1029(f)(3)(iii)(b)(1) - Regarding pushing - five specified steps not mentioned.

.1029(f)(3)(iv)(a) - Regarding maintenance and repair - nine specified procedures not included.

.1029(f)(6)(i) - The requirement for employers to establish and implement a written program to reduce exposures solely by means of engineering and work practice controls required in paragraph (f) of this section.

.1029(f)(6)(ii)(6) - The written program shall include at least five specified categories of information.

(See Exhibit C-24, Tr. 479-491)

Respondent defends that the deficiencies noted were corrected, after the inspection, either by another revision of the Training Program script, or by Safe Job Procedures or other types of documents such as Operating Procedures. This argument is not persuasive because the cited provisions of the Standard mandates that the missing information be incorporated in writing, in the training program. They were not at the time of the inspection.

The violation as alleged is established by the record herein.

REPEAT CITATION NO. 4 - ITEM 1(a) AND (b)

This Item alleges that frequent random inspections were not conducted by qualified individuals to assure that respirators were properly selected, used, cleaned and maintained (Item 1(a)); and every respirator wearer did not receive fitting instructions including demonstrations and practice in how the respirator should be worn, adjusted and properly fitted (Item 1(b)), as to the employees on both batteries, mandated by 29 C.F.R. 1910.134(e)(4) and (e)(5)(i), made applicable by Section .1029(g)(3) of the Standard.

The Stipulation establishes that Respondent was previously cited, under the 1910.134(e)(4) and (e)(5)(i) Standard on December 23, 1976, and did not contest these prior Citations. (Stipulation pp. 61, 62). Thus the 1976 Citations became a final Order of the Commission by operation of Section 10(a) of the Act, 29 U.S.C. 659(a).

As to Item 1(a), the evidence conclusively establishes that at the time of the inspection, there were no frequent, random inspections conducted to determine if the respirators used by the coke oven employees were properly used, cleaned and maintained.

As to Item 1(b), a dust type respirator, known as the Dustfoe 66, had been issued to the coke oven employees at Fairless. Complainant's Industrial Hygienist, who participated in the inspection, Mr. O'Malley, after analyzing the fit instructions given by Respondent to its workers concluded that the fit tests were not appropriate for the Dustfoe 66 type respirators.

The purpose of a fit test is to determine if the respirator face piece forms a sufficiently tight seal against the wearers face, to prevent leakage and thus have the respirator operate as designed.

The "negative" pressure test recommended by Respondent requires sealing the rectangular filter inlet with the palm of the hand, while wearing the respirator. A breath is then drawn in, (creating a negative pressure) and will remain negative if the seal is proper. The Dustfoe 66 respirator can not be effectively sealed in this type of test because the filter is rectangular and air is designed to come thru the filter not only from the bottom of the rectangular filter holder, but also from both sides. Thus, it is extremely difficult to cover both the rectangular inlet as well as the side inlets. (See Exhibit C-24A, photo. 13).

The "positive pressure" test involves exhaling with the respirator in place, (thus creating a positive pressure) with the exhalation ports covered with the palm or fingers. This test is not effective with the Dustfoe 66 respirator because the exhalation ports are covered by a plastic cover, which prevents the sealing of the ports with the hand or fingers. (See Exhibit C-24A, photo 14).

Thus, these two tests, specified by Respondent in its respirator program Exhibits C-22, C-23, and Training Program Exhibit C-24, are neither effective nor appropriate for the type of respirator supplied to the workers by Respondent. Mr. O'Malley pointed out, that these types of tests are appropriate for cartridge type respirators, but not for the Dustfoe 66 type. Further, Mr. Bauman, an industrial hygienist with U. S. Steel testified that he had difficulty conducting these types of tests himself and recognized that there are more efficient types of tests available for the Dustfoe 66 type of respirator. Further, the evidence does not reveal any opportunity afforded the workers to practice the fit

tests under proper supervision, and, at least one witness devised his own test - if he could breath and the respirator "felt right," he concluded it fit properly.

The evidence establishes the conditions as alleged.

As to the accurate categorization of these violations as "Repeated," the Review Commission, to date, has not established its position as to what constitutes a "Repeat" violation.[25/]

The record establishes that the prior, 1976 respirator violations, were all connected with U. S. Steel's open hearth operations at Fairless, not its coke oven operations. Thus, because there is no clear Review Commission precedent, as yet, as to the elements of a "Repeat" violation, and because the respirator violations herein determined to exist involve, at least to a significant degree, the Fairless coke oven employees resistance to wearing respirators, it is concluded that these violations are accurately denomininated as Serious, not Repeated, and they are so modified. Further, the proposed penalty for this violation, is reduced from $1400 to $1000.

NONSERIOUS CITATION NO. 5 - ITEM NO. 1[26/]

This Item alleges that hot and cold, or tepid running water was not provided in the lavatory at the East side of the Coke Battery, contrary to the Standard set forth at 29 C.F.R. 1910.141(d)(2)(ii).

---

25/ The Commissioners have different views. See, Secretary of Labor v. Bethlehem Steel Corp., 20 OSAHRC 227(1975) and Secretary of Labor v. George Hyman Construction Co., OSHRC Docket No. 13559 (1977). Neither is their agreement by the Courts.

26/ This Nonserious Citation set forth four alleged violations. Respondent contested only Item No. 1. Thus, Items numbered 2 through 4 and the $100 penalty proposed for each have become the final Order of the Review Commission by operation of Section 10(a) of the Act, 29 U.S.C. 659(a).

It was stipulated that there was a lavatory at the cited location and that at the time of the inspection, it only had cold running water, the hot water pipe was not operative. (Stipulation, p. 63; as amended Tr. 639).

The evidence reveals that the water pipes servicing this lavatory would, with some degree of regularity, freeze during cold weather, stopping all water supply. Upon the employees complaints, they would be thawed by steam, but shortly freeze up again. On occasion, the water to the pipes would be shut off to prevent freezing - and of course, during these periods, no water would be available at the lavatory. This condition had existed for a long time - probably in excess of a year.

The violation as alleged is established in the evidence. The zero penalty proposed is inappropriate. Because the nonfunctioning water pipes made cleaning of the respirators, and washing before eating (established in other Items in this case) either impossible or inconvenient - the workers would have to go elsewhere to wash - a penalty of $250 is appropriate for this violation.

THE PENALTIES

With the exceptions noted supra, all proposed penalties are reasonable and appropriate.

Section 17(j) of the Act, vests in the Review Commission the authority to assess all civil penalties under the Act, giving due consideration to the size of the business of the employer being charged, the gravity of the violations, the good faith of the employer and the history of previous violations.

## SIZE

Respondent, U. S. Steel Corporation, is the largest domestic steel producer in the United States, with approximately 167,000 employees (located at various locations in this country, one of which the work site here involved, Fairless Hills, Pennsylvania), and had gross 1976 sales of approximately nine billion dollars.[27/] It has seven coke oven installations throughout the country, one of which, Clairton, reportedly being the largest such facility in the country. One of its coke oven plants is located at its Fairless Works and consists of two Batteries, with a total of 174 ovens with the usual attendant machinery and facilities. Thus, Respondent is a large, if the not the largest, coke oven operator in this country. The evidence is not conclusive on this point. It is the largest steel producer.

## GRAVITY OF THE VIOLATIONS

Contrary to Respondent's argument in brief, the gravity of the violations is high. The increased risk of cancer of the genito-urinary and pulmonary systems, and perhaps a lesser, but nevertheless an increased risk of skin cancer, as well as the risk of other pulmonary conditions, is fully discussed and extensively documented in the preamble to the new Coke Oven Standard. (41 F.R. 46744-46748 - III Coke Oven Emissions - Exposure Hazard). Thus, the cancer producing potential of coke oven emissions is not open to question in this case, and indeed, "... was not disputed by participants at the rulemaking proceeding [which

---

27/ See Decision and Order, Secretary of Labor v. U. S. Steel Corporation, OSHRC Docket No. 77-1796, dated April 24, 1978, pp. 4, 5; docketed for review by Commission Order dated May 25, 1978.

preceded promulgation of the Coke Oven Standard], including the five largest steel companies [thus including U. S. Steel], and the American Coke and Coal Chemical Institute." (41 F.R. 46746 - bracket material supplied.

At the present time, the seriousness of cancer to humans, even the usually non-lethal, treatable skin cancer, is so well recognized, not only by the qualified medical and scientific community but by the community in general, to be a proper subject for administrative notice, not necessary of any proof.

Respondent's argument that, "Nothing in the evidence before the Review Commission, however, indicated that a moment's exposure to a coke oven emission would cause cancer. There is no support in the record for a 'one-shot' theory.", (Brief, next to last page). This argument not only misses the mark, but is yet another demonstration of this Respondent's attitude relative to the Coke Oven Standard generally - disbelief, disagreement and noncompliance.

First, it is common knowledge that the precise ways that various types of cancer, are either initiated or progress, is not well-known, even to those qualified in the field of cancer research and treatment. Thus, a considerable amount of time - i.e., years, may elapse from the time of either initial or continued exposure to cancer causing elements and the appearance of its symptoms.

Secondly, the evidence of this record conclusively establishes that the coke oven workers at Fairless were not exposed to "a coke oven emission," nor to any type of "one-shot" exposure. Rather, the evidence establishes that these workers, for over a year at the very minimum, (and

in all probability for some considerably longer period) were exposed to massive and continuous emissions. Because Respondent decided not to rehabilitate its batteries, as recommended by its own engineers, for over a year after the recommended time frame, the batteries were in such an atrocious state of disrepair that they were literally burning up. The emissions were so massive that visibility atop the batteries, at times, was so reduced that the workers could not see. The photographic exhibits clearly show the "smoking ovens" - visible coke oven emissions.

Further, the evidence establishes that all the coke oven workers were exposed to these massive emissions, for extended periods of times, because of Respondent's failure to implement or enforce an adequate respirator program or to expeditiously provide environmentally controlled machine cabs or standby booths. Thus, the gravity of the violations is concluded to be high.

RESPONDENT'S GOOD FAITH

The record in this case establishes a striking lack of this Respondent's good faith, that is, as a practical matter, Fairless Management's lack of good faith. It is a record of interminable delay in complying with the new Coke Oven Standard. Thus, each violation herein determined, and the number of such violations, paint a graphic picture of Respondent's lack of conviction that its coke oven workers were exposed to an increased risk of cancer, and its resultant resistance and delay in implementing the provisions of the Standard.

Thus, stage charging - a well known engineering control to reduce emissions, was not implemented at Fairless - whereas it had been implemented at the Fairfield coke ovens in 1974, at the Provo, Utah, ovens in 1975, and

at the Clairton ovens in 1973. Fairless management's track record in this area puts them near if not in last place among U. S. Steel's seven coke oven plants.

Although U. S. Steel's own Pittsburgh engineers had, years ago, determined that adequate aspiration of the off-take system was possible even with the Corliss valves in place, and Fairless increased the aspiration capacity of its system, (through larger pipes installed by an outside contractor), years went by before Fairless management detected that some of the work of the outside contractor was improper and the aspiration system was not adequate.

Mechanized gooseneck cleaners were not used at Fairless yet had been used successfully at other U. S. Steel coke plants for years.

Because of the decision not to rehabilitate the batteries as recommended by its own Pittsburgh engineering inspection team, until over a year after the scheduled rebuild, the oven doors, jambs and frames became so badly deteriorated, that it was impossible to produce adequate spare doors in the admittedly inadequate door facility, nor to make many of the existing doors seal properly. Chuck door gaskets simply were not used - in clear and plain violation of the Standard.

Inspection of the standpipes and goosenecks was not done prior to each charge, and was not intended to be so carried out, in direct violation of the Standard. Rather, Respondent, scheduled such cleaning only once a week. Further, a clogged standpipe would be detected only after the coke cycle began - and could not be cleaned for 16 hours - until after the coke was pushed - allowing 16 hours of coke oven emissions to escape - hardly a "one-shot" emission.

The corrective action program - patching the ovens to keep them going, and putting out the door and frame fires, was a desperate effort to get more coke from the ovens - regardless of the amount of coke oven emissions caused by the holes, cracks, broken frames, and smoking and burning doors and frames. Even this vital (for production) activity was unsuccessfully attempted with a totally inadequate number of workers. Three patching crews, on the day shift only, totalling six men, worked five days a week. One crew's time was totally taken casting door plugs. Thus only two patchers, each with a helper, were available to try to patch all the leaks in both batteries. Such a minimum crew was obviously doomed to failure from the outset in the face of the magnitude of the patching tasks which they were expected to perform. This case conclusively establishes, among other things, the woefully inadequate staffing of these coke ovens.

Respondent's approach to respiratory protection of its coke oven workers, obviously critically required in the presence of such extensive emissions, similarly displays its lack of good faith. The workers were given the Dustfoe 66 respirators, initially without adequate instructions. Management thereafter incorporated some instructions on respirator use, maintenance and fit in its Training Program. However, the fit test was inappropriate for the type of respirators issued. More importantly however, was management's failure to enforce the use of the respirators, which resulted in half of the workers and a significant number of foremen, not utilizing them correctly. This dismal condition was at least in part caused by a lack of proper training.

One major cause of the problems encountered at the Fairless coke oven facility is precisely management's lack of concern for the health of its coke employees.

An encapsulated example of this lack of good faith is clearly set out in the opening paragraphs of its Training Program, which states:

> You are here to be informed about a new federal law which became effective January 20, 1977. This law was imposed by the Occupational Safety and Health Administration upon all people who work in coke plants throughout the United States.
>
> They say there is an increased risk of acquiring cancer for those who are exposed to coke emissions, and this is an attempt to reduce this risk.
>
> (Exhibit C-24)

One need not have a university degree to catch the obvious implications of such statements. The result, of course, is a lack of conviction by the employees that real hazards exist at the coke ovens, and Respondent's failure to comply with the Coke Oven Standard - which this case clearly demonstrates.

Further, because respirators are admittedly difficult to wear in the extremely hot, ash laden coke oven environment, the Standard provides for air conditioned booths on the mobil equipment and standby pulpits on the topside of the ovens - places where employees might go briefly - to catch their breaths in a relatively emission free atmosphere. This case establishes that although such booths and cabs had been supplied at three other U. S. Steel coke oven facilities, none were in place as of the time of trial herein (May, 1978), at Fairless. Rather than utilize the specific engineering knowledge, drawings and techniques which must have existed at U. S. Steel's headquarters offices in Pittsburgh, Fairless management

started at ground zero to design, and negotiate contracts, to have these booths produced and supplied. Rather than expediting this process, the evidence shows extensive delays, with little or nothing being done to get these booths in place.

Further, Respondent's lack of concern for its coke oven employees' health is also dramatically demonstrated by its failure to warn its employees of the dangers inherent in laundering their outside work clothes. Thus, the employees, unaware of these risks, took their work clothes home to be washed by their wives, - perhaps in the family wash, prior to the time that laundering was contracted out to a commerical laundry. Consequently, these employees were deprived of the opportunity of warning their loved ones of the potential dangers - and of making arragements to protect their families.

Such a course of calloused inaction is the antithesis of good faith.

HISTORY

Exhibit C-31 consists of six pages of a computer printout showing some information concerning previous inspections of the Fairless works by OSHA. Between July, 1972, and July, 1977, approximately 33 inspections had been conducted. Twenty-four of these inspections were made upon employee complaints, six because of accidents and three in the routine general manner. Eighteen inspections revealed no citable violations whereas citations did issue after 15 such inspections, involving 104 alleged violations, of which 18 were labeled serious. (The exhibit does not reflect how these citations terminated).

Respondent in brief, argues, "Given the size of the plant, Respondent submits that this is an excellent record." (Brief, second next to last, unnumbered page).

Exhibit C-31 establishes, not an excellent record, but a rather poor record. One hundred four citable conditions (not counting the violations in this case - approximately 40), found in five years, can not realistically or reasonably be labeled "excellent."

Thus, for the foregoing reasons, the penalties proposed, except where indicated supra, are appropriate and reasonable.

DENOMINATION OF THE VIOLATIONS

Section 17(k) of the Act, 29 U.S.C. 666(j) provides:

> (k) For purposes of this section, a serious violation shall be deemed to exist in a place of employment if there is a substantial probability that death or serious physical harm could result from a condition which exists, or from one or more practices, means, methods, operations, or processes which have been adopted or are in use, in such place of employment unless the employer did not, and could not with the exercise of reasonable diligence, know of the presence of the violation.

The evidence establishes that all the violations set forth in Citations numbered 1, 2, 3, and, as modified, 4 are properly denominated as Serious because of the cancer and other health risks inherent in coke oven emissions. Citation number 5 is properly denominated as Nonserious.

THE UNION'S POSITION

The United Steelworkers of America, AFL-CIO, Local 4889 is a party in this case.

In general, the Union supports the Complainant regarding the existence of the violations, as alleged, with some modifications.

First, the Union asks that a violation of Section .1029(c) - the permissible exposure limit (PEL) be found for each employee exposed to coke oven emissions in excess of the PEL, rather than as charged as

one violation per battery, for all such exposed employees in Items No. 1 of Citation No. 1 and 2. Further, that Respondent's inadequate respirator program, charged under Item No. 1(a) and (b)[28/] of Citation No. 3, should additionally be constructed as a violation of the PEL Section .1029(c), because respirator use is allowable under Section .1029(g) of the Standard only during the period necessary to install and implement the engineering and work practice controls. Because Respondent has gone beyond this necessary time, respirators may not be relied upon to reduce employee exposure (even if the respirator program was effective), hence a PEL violation should be found. Separate penalties should consequently be assessed.

This coke oven case, perhaps the first brought to trial under the new Coke Oven Standard, was evidently closely monitored by OSHA supervisory personnel in Washington, DC, to attempt to assure an evenhanded and consistent approach to the potentially numerous coke oven cases which may follow. (See testimony of Regional Industrial Hygienist Garecke, Tr. 492-535). The purpose was to develop a coherent, national policy to fairly implement this new Standard. Thus, although the Unions position is inventive, the manner in which the foregoing violations have been charged is considered to be the proper exercise of the Secretary's administrative discretion, and entitled to great weight. See; GAF Corporation v. OSHRC; 561 F.2d 913(D.C. Cir., 1977). The Secretary's position is legally proper and

---

28/ Item 1(c) was deleted by Stipulated Agreement (Stipulation, p. 50).

will accomplish the purposes of the Act - employee health and safety. Thus, this position of the Union is not adopted.

Second, the Union asks that abatement dates, for the installation of the required air filtered equipment, (Citation No. 1, Items No. 12, 13; Citation No. 2, Item No. 14) be established at a minimum date consistent with Complainant's Program Directive No. 300-10.

The subject of reasonable abatement dates was not the subject of any extensive evidence of record, and was not fully litigated. Thus, it is inappropriate, and because of the lack of evidence impossible, at this stage of the proceedings to alter the abatement dates set forth in the Citations.

Lastly, the Union asks the Commission, under the authority of Section 10(c) of the Act, (29 U.S.C. 659(c)), to direct "other appropriate relief" in the form of an order ..."directing the Respondent to discuss with the Union the details of (such) a personnel program and to implement a sufficient increase in manpower within a reasonable time period."

There is no question that the record herein establishes that one of the major problems at Fairless (but only one) was an inadequate number of coke oven employees to carry out the work practices mandated by the coke oven Standard. Thus, Respondent's failure to provide an adequate number of spare oven doors, its failure to inspect and clean standpipe and goosenecks prior to each charge, its failure to control door emissions, its failure to regularly inspect and promptly repair the damper and aspiration systems, its failure

to regularly inspect and promptly repair standpipes and their caps and to implement temporary repairs to prevent miscellaneous fugitive topside emissions, all were due, in part, to a woefully inadequate number of employees to carry out these tasks.

However, inadequate employees was only one major cause of the cited violations. Of equal importance was Fairless management's lack of commitment to implement the coke oven provisions, "at the earliest possible time."

Thus, although an Order, such as requested by the Union, may possibly be authorized under Section 10(c) of the Act,[29/] or under either the Third Circuit's opinion in the Atlantic and Gulf Stevedores v. OSHRC, case, 534 F.2d 541 (3rd Cir., 1976), or the Commission case of Secretary of Labor v. General Electric Company, OSHRC Docket No. 2739, aff'd 540 F.2d 67 (2nd Cir., 1976), it is concluded that such an Order in this case is not appropriate. The number of employees necessary to legally conduct a business is a matter more appropriate for the collective bargaining table. However, if this Respondent continues to be in violation of the Coke Oven Standard, for any nonjustifiable reason - and inadequate personnel is such a legally inadequate reason, it will be subject to further citation. Thus, this request of the Union is denied.

Additionally, the Union asks for a similar Order from the Commission to direct the Respondent to consult with the employee representatives to correct serious deficiences in its respirator

---

29/ As pointed out, the legislative history of the Act is silent on this "other appropriate relief" provision.

program, i.e., a correct definition of the "regulated area" in its Training Program (to include the "old" lunchroom and foremen's offices between the two batteries - not so classified) and to correct its inadequate respirator practices.

Although the Union is to be congratulated for its offer to assist Fairless management in understanding and implementing these respirator requirements of the Standard, (this record could support a conclusion that Fairless management may need some help and does establish that Union counsel has an outstanding grasp of this Standard),[30/] the responsibility for understanding and implementing the Standard's provisions rests with Respondent's management as a matter of law. Thus, the requested Order is legally unnecessary. However, nothing in the Act prevents, indeed, Section 2(b)(1) of the Act, 29 U.S.C. 651(b)(1) encourages, cooperation between employers and employees to accomplish healthful working conditions. Thus, enlightened management might avail themselves of the Union's offer of help. In the end however, failure of this Respondent to accept and discharge the responsibilities placed upon it by the Act, may well result in further citations for violations thereof.

RESPONDENT'S DEFENSES AND ARGUMENTS

Respondent's first argument involves the question of when the obligation to implement the engineering and work practice controls

30/ The preparation for (i.e., Stipulation, etc.) and trial of this case was significantly aided by the high professional competence and devotion of Union counsel, Mary-Win O'Brien, Esquire.

and respirator use under the new Coke Oven Standard becomes legally binding upon it, "at the earliest possible time," or January 20, 1980.

Section .1029(f)(i)(a) and (b) of the Standard sets forth the requirements for the Priority of Compliance Methods - for existing coke oven batteries, in the following language:

> (f) Methods of compliance.
>
> The employer shall control employee exposure to coke oven emissions by the use of engineering controls, work practices and respiratory protection as follows:
>
> (1) Priority of compliance methods.
>
> (i) Existing coke oven batteries.
>
> (a) The employer shall institute the engineering and work practice controls listed in paragraphs (f)(2), (f)(3) and (f)(4) of this section in existing coke oven batteries at the earliest possible time, but not later than January 20, 1980, except to the extent that the employer can establish that such controls are not feasible. In determining the earliest possible time for institution of engineering and work practice controls, the requirement, effective August 27, 1971, to implement feasible administrative or engineering controls to reduce exposures to coal tar pitch volatiles, shall be condsidered. Wherever the engineering and work practice controls which can be instituted are not sufficient to reduce employee exposures to or below the permissible exposure limit, the employer shall nonetheless use them to reduce exposures to the lowest level achievable by these controls and shall supplement them by the use of respiratory protection which complies with the requirements of paragraph (g) of this section.
>
> (b) The engineering and work practice controls required under paragraphs (f)(2), (f)(3) and (f)(4) of this section are minimum requirements generally applicable to all existing coke oven batteries.

* * *

> Wherever the engineering and work practice controls which can be instituted are not sufficient to reduce employee exposure to or below the permissible exposure limit, the employer shall nonetheless use them to reduce exposures to the lowest level achievable by these controls and shall supplement them by the use of respiratory protection which complies with the requirements of paragraph (g) of this section.[31]

What the Secretary meant, by the phrase "at the earliest possible time," is explained, at length in the preamble to the new Standard, at pages 46760, 46772. His position, essentially, is set forth at page 46773 of the preamble, as follows:

> Finally, a difficult compliance issue presented by the promulgation of the new standard involves its relationship, within the context of enforcement, to the employer's legal obligations under

---

31/ Section .1029(g) in relevant part provides:

(g) Respiratory protection.

(1) General.

(i) Where respiratory protection is required under this section, the employer shall provide and assure the use of respirators which comply with the requirements of this paragraph (g). Compliance with the permissible exposure limit may not be achieved by the use of respirators except:

(a) During the time period necessary to install or implement feasible engineering and work practice controls; or

(b) In work operations such as maintenance and repair activity in which engineering and work practice controls are technologically not feasible; or

(c) In work situations where feasible engineering and work practice controls are not yet sufficient to reduce exposure to or below the permissible exposure limit; or

(d) In emergencies.

> the prior standard (29 C.F.R. 1910.1000, 1002). The present standard, at paragraph (f)(1)(i) requires the implementation of specific engineering controls and work practices at the earliest possible time but not later than January 20, 1980. To this end, employers are presently required to develop written programs and to implement specific controls. However, the agency recognizes that employers had a legal obligation under the prior standard to reduce coke oven emission exposures by means of feasible engineering and administrative controls. It is not the intention of the agency, through the promulgation of this standard, to vitiate the legal requirements under the old standard. Rather, OSHA views the two standards as representing continuum of enforceable obligations which have been crystallized in the standard's promulgation.
>
> More specifically, in evaluating whether the employer has instituted controls at the earliest possible time, OSHA compliance personnel would consider not only the employer's performance under the new standard but also his prior obligations under its predecessor. It is OSHA's view that recalcitrant employers who have implemented only a few or no controls or work practices under the prior CTPV standard should not benefit from a newly extended time frame established under the new standard. Rather, cognizant of their prior legal obligations, such employers would be subject to citation under the new standard for failure to implement controls at the earliest possible time.
>
> (41 F.R. 46773, October 22, 1976)

Respondent argues that because there is no evidence in <u>this</u> record that Fairless employees were exposed to coal tar pitch volatiles in excess of the 1971 TLV (Threshold Limit Value) prior to the effective date of the new Standard, January 20, 1977, there is thus no

basis to conclude that it had any obligation to implement any engineering controls, work practices or "even" respirators prior to January 20, 1977.

Although, technically correct concerning the state of the evidence herein, this argument, in essence, asks for a determination that the Fairless coke ovens were in complete compliance with the old Standard covering coke oven emissions. As Respondent points out, there is no evidence in this record to support such a conclusion. Even if one assumes such a state of facts however, this does not mean that Respondent, prior to the new Coke Oven Standard, had no legal obligation to reduce, and maintain the old coal tar level emissions, below the TLV. Respondent's argument is construed as an affirmative defense and thus the burden of establishing complete compliance with the "old" Standard, rests upon Respondent, not accomplished by it in this record. In fact, the evidence of this record, best supports the contrary conclusion. Respondent asks too much with this argument, as it strains credulity to conclude that the Fairless Batteries, on January 19, 1977, had no coke oven emissions, when at the time of the inspection, some 60 days later, they were admittedly in such a seriously deteriorated condition, that they were "burning down," being held together with "rubberbands and chewing gum" (Tr. 792), and were producing extensive coke oven emissions.

Further, there is absolutely no showing by Respondent, of what "feasible engineering or administrative controls" were actually implemented prior to the new Standard, which it had a legal obligation

to do, and yet, when inspected in March-April, 1977, well-known engineering controls, i.e., stage charge, and quickly implementable work practices, i.e., proper inspections and repairs, were not in place.

It is concluded that this argument of Respondent is not persuasive.

Secondly, Respondent's next major argument it entitles "The Statute of Limitations Problem." (Brief, Section H). This argument, essentially, is that Section 9(c) of the Act, 29 U.S.C. 658(c), provides that, "No citation he issued under this section after the expiration of six months following the occurrence of any violation." (Emphasis supplied). Respondent then argues that because Complainant's position is that Respondent did not implement "feasible engineering or administrative controls" under the "old" Standard, prior to January 20, 1977, Complainant, in the Citations herein, is, in effect, citing Respondent for "violations" prior to the six month statute of limitations.

This argument confuses the terms "obligations" and "violations." Section 9(c) prohibits the issuance of any "citation" for any "violation" more than six months old. It is silent as to preexisting "obligations."

The Citations at issue here conform to the statutory mandate of Section 9(c) of the Act. The "violations" set forth in the Citations herein occurred at or about the time of the inspection, March-April, 1977. These "violations" were a failure to comply with many provisions of the new Coke Oven Standard, "at the earliest possible time" - that is, at the time of the inspection.

|---|---|---|---|---|

Since 1971 Respondent, under the "old standard," had a legal "obligation" to reduce coal tar pitch emissions (synonymous to the new coke oven emission) to the old TLV level. This "obligation" was to be discharged by utilizing "feasible engineering and administrative controls," and Respondent was under this "obligation" from 1971 to January 19, 1977. Thus, when the inspection herein took place in March, 1977, and it was found that historically well-known and available engineering controls such as stage charging, and work practices (i.e., administrative controls) such as inspections and repairs, mandated under the new Standard had not been implemented, such a lack of these controls were cited as "violations." In determining whether this Respondent was legally obligated to have these controls, in place, at the time of the OSHA inspection, that is, "at the earliest possible time," nothing in Section 9(c) of the Act precludes a consideration of how well or whether Respondent discharged its pre-1977 "obligations" under the prior Standard.

Consequently, because the Fairless ovens, at the time of the inspection, were found to be "burning down," and producing extensive emissions, and because the OSHA inspectors found a lack of pre-1977 "feasible engineering and administrative controls," in place, even as late as March, 1977 - when the "obligation" to implement them had existed since 1971, it was concluded that Respondent had not complied with the new Standard "at the earliest possible time," and thus, was in "violation" of the new Standard. Nothing in Section 9(c) of the Act prohibits such a procedure.

This argument of Respondent is not supported by either the law or logic.

Respondent's next major argument, is labeled "The Constitutional Problem." In essence, the argument is that the Secretary's interpretation of the "at the earliest possible time" requirement in the new Standard, is an attempt to impose the new Standards requirements retroactively to 1971 and this constitutes "ex post facto" lawmaking, prohibited by Article I, Section 9 of the Constitution.

This argument is not persuasive because, the "at the earliest possible time" phrase, does not make the new Coke Oven Standard requirements, retroactively effective, nor does it effect prior legal obligations. As discussed supra, coke oven operators, since 1971 under the "old" Standard, had the legal obligation to reduce employee exposure to coal tar pitch volatiles by utilizing feasible engineering and administrative controls.

Because of the high gravity of the cancer risk caused by exposure to coke oven emissions, the Secretary concluded that the specific engineering and work practice controls mandated under the "new" Standard, must be implemented as soon as possible but not later than January 20, 1980. Some of the specific controls mandated under the "new" Standard, i.e., stage charging and inspection and repair measures, have been well-known, feasible, available, and utilized by some coke oven operators, for a number of years, that is, they have been available for implementation under the label of "feasible engineering or administrative controls," as used in the "old" Standard, for many years. Thus, in order to determine whether any given coke oven operator has implemented the specified "engineering and work

practice" controls spelled out in the "new" Standard, as soon as possible, nothing in the Constitution prohibits a consideration of whether an operator has discharged its preexisting legal obligations.

Further, as pointed out by the Union the ex post facto prohibition in the Constitution has been interpreted by the Courts to be applicable to laws which are criminal or penal in nature and must alter the situation of the accused to his disadvantage.

Further, the Review Commission, the Courts teach, does not have jurisdiction to decide questions involving the constitutionality of the Act. (See American Smelting and Refining Company v. OSHRC et al. 501 F.2d 504 (8th Cir., 1974)).

Lastly, there is no indication that this "constitutional" argument was presented to the appropriate Court for resolution; the United States Third Circuit Court of Appeals, when the coke industry, including Respondent herein, asked that Court to review the legality of the new Coke Oven Standard. Thus, this argument can well be construed as a collateral attack upon the Standard, prohibited in an enforcement action, such as this action.

This argument must be disallowed.

The next major argument by Respondent is labeled "The Two Battery Issue." This argument, essentially is, that because the two batteries at Fairless are really one operation, the Secretary should not have issued two Citations, Serious Citation No. 1 dealing with the violations found at Battery No. 1, and Serious Citation No. 2 dealing with the violations found at Battery No. 2, but rather only one Citation.

This argument is not persuasive for a number of reasons.

The Standard defines a coke oven battery as "... a structure containing a number of slot-type coke ovens."

29 C.F.R. 1910.1029(b)

Respondent had two such structures at Fairless, which it has designated as "Battery 1 and Battery 2.", (Stipulation, p. 5), and which it has considered to be two distinct entities, at least until this argument has appeared.

The coke oven industry generally considers each Battery a distinct entity, and the Secretary has adopted such a distinction in the Standard. (See .1029(f)(3)(i)(a) - use of term "each battery").

Most important, however, is the fact that each Battery is the potential source of emissions, and consequently, each Battery must be equipped with the specified engineering controls and the mandated work practices must be followed on each Battery. (Theoretically, each oven could have been the unit of measuring the extent of emissions and consequently number of violations - but the Secretary has not so determined).

Further, the Review Commission's function under the Act is, to exclusively, adjudicate, not to engage in rule making.

It is concluded that the Secretary's determination to use a coke battery as the appropriate unit for regulation, in light of coke oven industry practice (including this Respondent) is reasonable, will accomplish the purposes of the Act, and is the proper exercise

of his administrative discretion. Nothing in this record warrants overruling, or changing this administrative determination, and this argument by Respondent is found to be unpersuasive.

The last main argument of Respondent concerns the creditibility of two of Complainant's witnesses, (who were also two, longtime coke oven employees at Fairless) Messrs. Offenheiser and Siminitus. In over four pages of its Brief, (Section III, R.p. J-47), Respondent argues that this testimony is unreliable and should not be relied upon.

It is true, that these two men gave some contradictory testimony and, after a close anaylsis of the testimony as well as their demeanor while testifying, coupled with the record of this case in its entirety, it is concluded that these two employees were (and probably still are) angry with Fairless management for its lack of concern for the coke oven employees health and safety.[32/] Because of these inconsistencies, the weight of this testimony is reduced and exclusive reliance thereon has not been made, just as the weight of one of Respondent's witnesses, Mr. Seidenberger, has been reduced, because of his evasive and non-responsive answers, and little reliance placed thereon.

All other arguments put forth by Respondent have been individually considered and analyzed, and it is determined that they are not

---

32/ This anger is not completely unjustified. See the section herein concerning managements failure to warn its employees about laundering coke oven soiled clothes at home, i.e., "Penalty" - "Good Faith" section.

persuasive as not being supported by the creditable evidence of this record or the law.

## CONCLUSION

The jurisdiction of the Review Commission in this case is not contested and is established by the pleadings and stipulated facts, pursuant to Sections 3(4)(5) and 10(c) of the Act.[33/]

Based upon the foregoing and pursuant to Sections 10(c) and 12(j) of the Act,[34/] it is hereby

ORDERED:

That the following violations of 29 U.S.C. 654(a)(2), for failure to comply with the identified Sections of the Coke Oven Standard set forth at 29 C.F.R. 1910.1029, are determined to have existed as alleged in the Citations specified below, which Citations and penalties proposed thereon, except as specifically noted, are

AFFIRMED:

1. Serious Citation No. 1 - Items numbered 1 through 13 except Item No. 4, in part.
2. Serious Citation No. 2 - Items numbered 1 through 15 except Item No. 5, in part.
3. Items numbered 4 in Citation No. 1 and 5 in Citation No. 2, so far as they relate to "mechanized standpipe cleaners," are VACATED. The proposed penalty of $1,000 for each of these Items is reduced to $500 for each.

---

33/ 29 U.S.C. 652(4)(5) and 659(c).

34/ 29 U.S.C. 659(c) and 661(i).

4. Serious Citation No. 3 - Items numbered 1 through 6 except Item No. 1(c), which is VACATED. The proposed penalty of $1,000 for Item No. 1 is reduced to $500.
The proposed penalty of $1,000 for Item No. 3 is reduced to $500.

5. "Repeat" Citation No. 4, is modified to a "Serious" Citation and the proposed penalty of $1,400 is reduced to $1,000.

6. Nonserious Citation No. 5, Item No. 1. A penalty of $250 is appropriate.

7. A total penalty in the amount of $33,250 is ASSESSED.

William E. Brennan
WILLIAM E. BRENNAN
Adm. Law Judge, OSHRC

Dated: August 24, 1978
Hyattsville, Maryland

# APPENDIX A

## JOINT STIPULATION OF FACTS

A. Procedural History of the Case

1. On October 22, 1976, the Assistant Secretary of Labor for Occupational Safety and Health (hereinafter Assistant Secretary) promulgated a final standard for exposure to coke oven emissions at 29 CFR 1910.1029 (41 FR 46742).

2. This standard was effective January 20, 1977 except as set forth in paragraphs 4, 5 and 6 below.

3. On January 18, 1977, the Assistant Secretary issued corrections to the final coke oven emissions standard (42 FR 3304).

4. These corrections, among other items, included in #81 a change in the effective date for the initial training program from January 20, 1977 to January 27, 1977.

5. On January 18, 1977, the United States Court of Appeals for the Third Circuit issued an interim stay of the following sections of the standard:

a) 29 CFR 1910.1029(e) - exposure monitoring and measuring;

b) 29 CFR 1910.1029(g) - respiratory protection;

c) 29 CFR 1910.1029(h) - protective clothing and equipment;

and

d) 29 CFR 1910.1029(i) - hygiene facilities and practices.

A copy of the interim order has been submitted by the respondent pursuant to Judge Brennan's request at the February 21, 1978 pre-hearing conference.

6. On February 18, 1977, those portions of the standard that had been stayed became effective when the United States Court of Appeals for the Third Circuit vacated the interim order and denied motions for a permanent stay pending judicial review. A copy of the Court's order has been submitted by respondent pursuant to Judge Brennan's request at the February 21, 1978 prehearing conference.

7. On March 17, 1976, OSHA received an employee complaint requesting an inspection of respondent's coke oven batteries. A copy of the complaint is attached as Exhibit A-1. NOT ATTACHED

8. On March 22, 1977, representatives of the Occupational Safety and Health Administration (hereinafter OSHA) initiated an inspection at respondent's Fairless Works.

9. The opening conference, and walkaround participation by employer and employee representatives, complied with the provisions of the Occupational safety and Health Act (hereinafter the Act), applicable regulations and relevant provisions of the OSHA Field Operations Manual.

10. The on-site inspection continued from March 22, 1977 through April 4, 1977.

11. On September 12, 1977, a closing conference was held in accordance with applicable regulations and relevant provisions of the Field Operations Manual.

12. As a result of the inspection, on September 14, 1977, complainant issued five (5) citations and a Notification of Penaly assesing a total penalty of $35,700.

13. On October 3, 1977, complainant amended certain items of the citations.

14. On October 5, 1977, resondent filed a timely notice of contest to all citations, abatement dates and proposed penalties except, Respondent did not contest Items 2 through 5 of citation 5.

15. On October 20, 1977, the authorized employee representatives served a Notice of Election of Party Status on respondent and complainant.

16. Complainant served his complaint in a timely fashion on November 21, 1977.

17. Respondent's answer was timely served on December 5, 1977.

18. On December 5, 1977, respondent also served a Motion for an indefinite postponement of the trial date which was objected to by the authorized employee representatives on December 14, 1977 and by the complainant on December 20, 1977.

19. Respondent served a response to these objections on December 30, 1977.

20. Respondent's motion for indefinite postponement was denied on January 23, 1978 and a pre-hearing conference scheduled for February 21, 1978.

21. The authorized employee representatives filed a motion to expedite this proceeding pursuant to Commission Rule 101 on January 27, 1978.

22. Commissioner Cleary granted the employee representatives' motion by order dated February 9, 1978.

23. On March 28, 1978, the United States Court of Appeals for the Third Circuit affirmed the coke oven standard in all aspects relevant to this proceeding.

24. The hearing in this case is scheduled to begin on May 15, 1978.

B. Description of Respondent's Coke Oven Batteries

1. Respondent, United States Steel Corporation, is engaged in the production of steel and steel products.

2. Respondent is an employer engaged in a business affecting commerce as defined by Section 3(5) of the Act.

3. Respondent's home office is at 600 Grant Street, Pittsburgh, Pennsylvania.

4. Respondent maintains a steel manufacturing facility at Fairless Hills, Pennsylvania (hereinafter Fairless Works).

5. There are two coke oven batteries at respondent's Fairless Works.

6. Both batteries are Wilputte, combination, double divided, underjet batteries with eighty-seven (87) ovens per battery.

7. The dimensions of the ovens are as follows: each oven is 12 feet 2 inches high, 40 feet 7-5/8 inches long and an average of 18 inches wide.

8. Both batteries were built in 1952. Battery No. 1 was put into service in 1952 and Battery No. 2 was put into service in 1953.

9. Approximately 16 tons of coal is introduced into the oven per charge allowing for a calculated coal line of eleven feet, 2 inches.

10. The coke was heated to an average temperature of 2000° Fahrenheit and the average coking time was 16-1/2 hours at the time of the inspection.

11. Eighty-one (81) ovens were normally pushed each turn at the time of the inspection.

12. The following is a description of battery equipment:

a) Both batteries have double collector mains and three charging holes;

b) The larry car for Battery #1 is a turntable design built by Wilputte in 1952. Between August 23, 1976 and October 18, 1976, the Larry Car for Battery #1 was modified to include: (1) New drop sleeves, (2) New volumetric controls; (3) a new drive in the central turntable.

c) The larry car for Battery #2 is a turntable design built by Willputte in 1952.

d) The pusher machine for Battery #1 was built in 1952 by Wilputte;

e) The pusher machine for Battery #2 was built in 1952 by Wilputte;

f) The pusher and coke side door machines for Battery #1 were built in 1952 by Wilputte;

g) The pusher and coke side door machines for Battery #2 were built in 1952 by Wilputte;

h) The quencher car serving both batteries was built in 1952 by Wilputte.

i) There were no significant modifications to the equipment listed in subparagraphs (c) through (h) of this paragraph between 1952 and the time of the inspection.

CITATION 1 - Serious

| Violation | Abatement Date | Penalty |
|---|---|---|
| 1<br>29 CFR 1910.1029(c): Employees were exposed to coke oven emissions at concentrations greater than 150 micrograms per cubic meter of air for an average 8-hour period: | 3/15/79 | $1,000 |

a) Coke oven battery #1, Larry Car operator

b) Coke oven battery #1, Lidmen

c) Coke oven battery #1, coke side jamb cleaner

d) Coke oven battery #1, coke side door machine operator

e) Coke oven battery #1, push side door machine operator

Stipulation

1. At the time of the inspection, the following employees were exposed to coke oven emissions without regard to the use of respirators at concentrations greater than 150 micrograms per cubic meter of air (150 ug/m$^3$) averaged over 8-hour periods: TR 64, 65.

a) Larry Car Operators - Battery #1

(i) N. Eckert
(ii) T. Dredge

b) Lidmen - Battery #1

(i) Caldwell
(ii) R. Dylienski
(iii) K. Fillman

c) Coke side jamb cleaner - Battery #1

(i) D. Michael

d) Coke side door machine operator - Battery #1

(i) J. Babij

e) Push side door machine operator - Battery #1

(i) J. Galambos

| Violation | Abatement date | Penalty |
|---|---|---|
| 2<br>29 CFR 1910.1029(f)(2)(i)(a): The existing coke oven battery was not equipped and operated with one of the methods of charging outlined in subparagraphs (1) Stage Charging, (2) Sequential charging, (3) Pipeline charging, of this paragraph to control coke oven emissions during charging operations:<br><br>a) Coke oven battery #1, charging operations where employees were exposed to coke oven emissions | 10/15/77 | $1,000 |

Stipulation

1. Stage charging as described in 29 CFR 1910.1029(f)(3)(i)(b) was the charging procedure respondent considered applicable to Battery #1.

2. Stage charging as defined by the standard was not being performed on Battery #1 at the time of the OSHA inspection in that:

a) The center hopper contained more coal than either of the outer hoppers thereby increasing the likelihood of blocking the gas passage to the offtake system.

b) All charging hole lids were open at the same time.

c) All coal hoppers were discharged at the same time.

d) The drop sleeves were not operated individually.

3. Respondent's job breakdown form LC-8 for stage charging dated January 14, 1977 and attached as Exhibit C-1 contains a description of stage charging.

4. Respondent's compliance program at the time of the inspection stated that stage charging would be in operation by the third quarter of 1977.

5. The abatement date in the citation is reasonable in that respondent's compliance plan submitted to the Commission and the parties on January 4, 1978 states that stage charging was in effect on Battery #1 as of July 2, 1977.

| Violation | Abatement date | Penalty |
|---|---|---|
| 3<br>29 CFR 1910.1029(f)(2)(i)(c): The aspiration system was not designed and operated to provide sufficient negative pressure and flow volume to effectively move the gases evolved during charging into the collector mains, including sufficient steam pressure, and steam jets of sufficient diameter:<br><br>a) Coke oven #1, steam aspiration system, where employees were exposed to coke oven emissions | 3/15/78 | $1,000 |

Stipulation

1. At the time of the OSHA inspection, the steam aspiration system was inadequate to provide sufficient negative pressure and flow volume to move the evolved gases into the collector mains on Battery #1.

2. The steam jets or nozzles were 5/8 inch in diameter at the time of the OSHA inspection.

3. This nozzle size was inadequate to provide sufficient negative pressure and flow volume to move the evolved gases into the collector main on Battery #1.

4. Respondent's compliance plan submitted in connection with the motion for postponement of the trial date states that the aspiration system was increased during the repairs completed June 30, 1977.

5. The current nozzle size is 3/4 inch in diameter and the current pressure in the steam aspiration system is 70 to 75 p.s.i. measured at the header.

| Violation | Abatement Date | Penalty |
|---|---|---|
| 4. 29 CFR 1910.1029(f)(2)(i)(g): The existing coke oven battery was not equipped and operated with mechanized gooseneck and standpipe cleaners to control coke oven emissions during charging operations:<br><br>a) Coke oven battery #1, where employees were exposed to coke oven emissions | 9/15/78 | $1,000 |

Stipulation

1. Battery #1 was not equipped with mechanized gooseneck cleaners.

2. In the absence of these cleaners, the larry car operators manually cleaned the goosenecks with metal bars.

3. Respondent has installed mechanized gooseneck cleaners at some coke oven batteries at Respondent's Clairton, Gary and Fairfield Steel Works.

4. It is technically feasible to install mechanized gooseneck cleaners on Battery #1 at Fairless Works.

5. Respondent's compliance program at the time of the inspection contains an installation date for mechanized gooseneck cleaners of the last quarter of 1979.

| Violation | Abatement date | Penalty |
|---|---|---|
| 5<br>29 CFR 1910.1029(f)(2)(ii)(c): An adequate number of spare doors was not available for replacement purposes to control coke oven emissions during coking operations:<br><br>a) Coke oven battery #1, push side and coke side doors, where employees were exposed to coke oven emissions | 10/15/77 | $1,000 |

Stipulation

1. Battery #1 has 87 ovens with a total of 174 doors.

2. At the time of the inspection, all doors were Wilputte doors with spring loaded latches.

3. Of the 174 doors, 28 were noted as leaking coke oven emissions at the time of the inspection. (See Exhibit C-2.)

4. A list of the doors that were leaking was submitted to respondent on September 22, 1977.

5. A coke oven door consists of among other parts, a door frame, a door plug and sealing edges.

6. At the time of the inspection, respondent had around 15 spare door frames available for both batteries.

7. At the time of the inspection, it took 16 hours to make a door frame into a spare door.

| Violation | Abatement Date | Penalty |
|---|---|---|
| 6<br>29 CFR 1910.1029(f)(2)(ii)(d); The existing coke oven battery was not equipped and operated with chuck door gaskets to control chuck door emissions until such door could be repaired or replaced:<br><br>a) Coke oven battery #1, chuck door -- Battery #1 employees were exposed to coke oven emissions | 9/22/77 | $1,000 |

Stipulation

1. At the time of the inspection, certain chuck doors were leaking on Battery #1.

2. Respondent's compliance program at the time of the inspection stated that chuck door gaskets were in service.

3. Respondent was not using chuck door gaskets at the time of the inspection.

4. Chuck door gaskets were used on coke oven battery #1 beginning between July 14, 1977 and September 15, 1977.

5. The abatement date set forth in this Citation is reasonable.

| Violation | Abatement Date | Penalty |
|---|---|---|
| 7<br>29 CFR 1910.1029(f)(3)(i)(a)(2): Inspection and cleaning of goosenecks and standpipes was not conducted prior to each charge to a specified minimum diameter sufficient to effectively remove the evolved gases from the oven to the collector mains to control coke oven emissions during the charging operations:<br><br>a) Coke oven battery #1, push side and coke side goosenecks and standpipes, Battery #1 employees were exposed to coke oven emissions | 9/15/78 | $1,000 |

Stipulation

A. Standpipes on Coke Oven Battery #1

1. The inside diameter of a standpipe on Battery #1 is 13 inches.

2. The respondent has not specified a minimum diameter opening to be maintained for standpipes to effectively remove the gases from the ovens to the collector mains.

3. Respondent has not supplied employees with the necessary tools to measure the effectiveness of cleaning standpipes to a minimum diameter.

4. Respondent's Job Breakdown form LC-4 dated May 6, 1960 and revised February 14, 1977 states that prior to each charge, the larry car operator is to "scrape or chop carbon, tar or other buildup from underside of standpipe cap" and to

repeat that step on standpipes.

5. At the time of the OSHA inspection, employees were not cleaning each standpipe prior to each charge.

6. At the time of the inspection during each shift, approximately 40 ovens were charged. Each oven has two standpipes.

B. Goosenecks on Coke Oven Battery #1

1. The inside diameter of a gooseneck is 13 inches.

2. The respondent has not specified a minimum diameter opening to be maintained for goosenecks to effectively remove the gases from the ovens to the collector mains.

3. Respondent has not supplied employees with the necessary tools to measure the effectiveness of cleaning goosenecks to a minimum diameter.

4. Respondent's Job Breakdown form L-8 dated January 14, 1977 and revised February 14, 1977 for stage charging on ovens states that the lidman is to inspect goosenecks to insure they are clean.

5. At the time of the OSHA inspection, employees were not cleaning each gooseneck prior to each charge.

6. At the time of the inspection during each shift, approximately 40 ovens were charged. Each oven has two goosenecks.

| Violation | Abatement Date | Penalty |
|---|---|---|
| 8<br>29 CFR 1910.1029(f)(3)(ii)(d): The existing coke oven battery was not operated pursuant to an inspection system and corrective action program to control door emmissions to the maximum extent possible for the control of coke oven emissions during coking:<br><br>a) Coke Oven battery #1, push side and coke side oven doors -- Battery #1 employees were exposed to coke oven emissions | 10/15/77 | $1,000 |

Stipulation

1. Exhibit C-2 is a true and correct copy of the list of doors noted to be leaking during the course of the inspection and a description of the nature and extent of the leaks.

2. On 12/7/77 respondent revised its compliance program to incorporate Maintenance Procedure No. 1 which included a door emission inspection and corrective action program.

3. The abatement date in the citation is reasonable.

| 10<br>29 CFR 1910.1029(f)(3)(iv)(c): Regular inspection of the damper system, aspiration system and collector main for cracks or leakage, and prompt implementation of the necessary repairs was not conducted:<br><br>a) Coke Oven battery #1, where employees were exposed to coke oven emissions | 10/15/77 | $1,000 |

Stipulation

1. At the time of the inspection, components of the collector main (i.e., the Corliss valve) were observed to be cracked and leaking coke oven emissions. (Oven B-7 Pusher side)

2. It takes 3 to 4 hours to replace a defective Corliss valve including set-up and clean-up time.

3. On 12/7/77 respondent revised its compliance program to incorporate Maintenance Procedure No. 1 which included maintenance and repair of Corliss valves.

4. The abatement date in the citation is reasonable.

Stipulation

1. Quench car

a) The quench car serving batteries #1 and #2 was not equipped with positive-pressure temperature controlled filtered air at the time of the inspection;

b) It is technically feasible to install such a system for the quench car cab;

c) Respondent's compliance program at the time of the inspection contained an anticipated installation date of the 4th quarter of 1978;

2. Pusher machine - battery #1

a) At the time of the inspection, the pusher machine was not equipped with positive-pressure temperature controlled filtered air;

b) It is technically feasible to install such a system for the pusher machine cab;

c) Respondent's compliance program at the time of the inspection contained an anticipated installation date of the 3rd quarter of 1978;

3. Larry Car Battery #1

a) At the time of inspection, the #1 larry car cab was not equipped with positive-pressure temperature controlled filtered air;

b) It is technically feasible to install such a system for the larry car cab;

c) Respondent's compliance program at the time of the inspection contained an anticipated installation date of the 3rd quarter of 1978;

4. Push-side door machine - battery #1

a) The cab of the push-side door machine for battery #1 was not equipped with positive-pressure temperature controlled filtered air at the time of the inspection;

b) It is technically feasible to install such a system for the push-side door machine cab;

c) Respondent's compliance program at the time of the inspection contained an anticipated installation date of the 1st quarter of 1979. After the inspection, Respondent revised this date to the 4th quarter of 1979.

5. Coke side door machine battery #1

a) The cab of the coke side door machine was not equipped with positive-pressure temperature controlled filtered air at the time of the inspection;

b) It is technically feasible to install such a system for the coke side door machine cab;

c) Repsondent's compliance program at the time of the inspection contained an anticipated installation date of the 2nd quarter of 1979. After the inspection, Respondent revised this date to the 4th quarter of 1979.

---

13 (instance "c" deleted) -- amended 10/3/77

Stipulation

1. Top side standby pulpit - battery #1

a) There was no standby pulpit on battery #1 with positive-pressure temperature controlled filtered air at the time of the inspection.

b) It is technically feasible to install such a stand-by pulpit;

c) Respondent's compliance program at the time of the inspection contained an anticipated installation date of the 4th quarter of 1977. The equipment has been ordered and Respondent anticipates installation in the 3rd quarter of 1978.

2. Coke wharf

a) At the time of the inspection, there was no positive-pressure temperature controlled filtered air stand-by pulpit at the coke wharf;

b) It is technically feasible to install such a stand-by pulpit;

c) Respondent's compliance program at the time of the inspection contained an anticipated installation date of the 4th quarter of 1977. The equipment has been ordered and Respondent anticipates installation in the 3rd quarter of 1978.

Stipulation

A. Standpipes on Coke Oven Battery #2

1. The inside diameter of a standpipe on battery #2 is 13 inches.

2. The respondent has not specified a minimum diameter opening to be mainatined to effectively remove the gases from the ovens to the collector mains. See Respondent's Job Breakdown L-4 and L-8 for Lidman dated October 25, 1974 and revised February 14, 1977.

3. Respondent has not supplied employees with the necessary tools to measure the effectiveness of cleaning to a minimum diameter.

4. Respondent's Job Breakdown form LC-4 dated May 6, 1960 and revised February 14, 1977 states that prior to each

charge the larry car operator is to "scrape or chop carbon, tar or other buildup from underside cap" and to repeat that step on standpipes.

5. At the time of the OSHA inspection, employees were not cleaning each standpipe prior to each charge.

6. At the time of the inspection, during each shift, approximately 40 (check out) ovens were charged. Each oven has two standpipes.

B. Goosenecks on Coke Oven Battery #2

1. The inside diameter of a gooseneck on battery #2 is 13 inches.

2. The respondent has not specified a minimum diameter opening to be maintained for goosenecks to effectively remove the gases from the ovens to the collector mains.

3. Respondent has not supplied employees with the necessary tools to measure the efffectiveness of cleaning goosenecks to a minimum diameter

4. Respondent's Job Breakdown for L-8 dated January 14, 1977 and revised February 14, 1977 for stage charging on ovens states that the lidman is to inspect goosenecks to insure they are clean.

5. At the time of the OSHA inspection, employees were

not cleaning each standpipe prior to each charge.

6. At the time of the inspection, during each shift, approximately 40 ovens were charged. Each oven has two goosenecks.

| Violation | Abatement Date | Penalty |

| 9. 29 CFR 1910.1029(f)(3)(ii)(d): The existing coke oven battery was not operated pursuant to an inspection system and corrective action program to control door emissions to the maximum extent possible for the control of coke oven emissions during coking: | 10/15/77 | $1,000 |
| a) Coke oven battery #2, push side doors, battery #2 employees were exposed to coke oven emissions | | |

Stipulation

1. Exhibit C-2 is a true and correct copy of the list of doors on battery #2 noted to be leaking during the course of the inspection and a description of the nature and extent of the leaks.

2. On 12/8/77, respondent revised its compliance program to incorporate Maintenance Procedure No. 1 which included a door emission inspection and corrective action program.

3. The abatement date in the citation is reasonable.

**Stipulaton**

No stipulation as to this item.

| Violation | Abatement Date | Penalty |
|---|---|---|
| 14<br>29 CFR 1910.1029(f)(4)(i): Positive-pressure temperature controlled filtered air was not provided for the cabs of the following equipment: | 3/15/79 | $1,000 |

a) Pusher machine, coke oven battery #2

b) Larry car, coke oven battery #2

c) Push door machine, coke oven battery #2

d) Coke door machine, coke oven battery #2
Battery #2 employees were exposed to coke oven emissions

Stipulation

1. Pusher machine - battery #2.

a) At the time of the inspection, the pusher machine was not equipped with positive-pressure temperature controlled filtered air.

b) It is technically feasible to install such a system for the pusher machine cab.

c) Respondent's compliance program at the time of the inspection contained an anticipated installation date of the 2nd quarter of 1978.

2. Larry car - battery #2.

a) At the time of inspection, the #2 larry car cab was not equipped with positive-pressure temperature controlled filtered air.

b) It is technically feasible to install such a system for the larry car cab.

c) Respondent's compliance program at the time of the inspection contained an anticipated installation date of the 3rd quarter of 1978.

3. Push-side door machine - battery #2.

a) The cab of the push-side door machine for battery #2 was not equipped with positive-pressure temperature controlled filtered air at the time of the inspection.

b) It is technically feasible to install such a system for the push-side door machine cab.

c) Respondent's compliance program at the time of the inspection contained an anticipated installation date of the 1st quarter of 1979. After the inspection, Respondent revised this date to the 4th quarter of 1979.

4. Coke side door machine - battery #2.

a) The cab of the coke side door machine was not equipped with positive-pressure temperature controlled filtered air at the time of the inspection.

b) It is technically feasible to install such a

system for the coke side door machine cab.

c) Respondent's compliance program at the time of the inspection contained an anticipated installation date of the 2nd quarter of 1979. After the inspection, Respondent revised this date to the 4th quarter of 1979.

| Violation | Abatement Date | Penalty |
|---|---|---|
| 15<br>29 CFR 1910.1029(f)(4)(ii): Stand-by pulpits equipped with positive-pressure, temperature controlled filtered air were not provided in the following location:<br><br>a) Topside of coke oven battery #2, where employees were exposed to coke oven emissions. | 3/15/78 | $1,000 |

Stipulation

1. Top-side stand-by pulpit battery #2.

a) There was no stand-by pulpit on battery #2 with positive pressure temperature controlled filtered air at the time of the inspection.

b) It is technically feasible to install such a stand-by pulpit.

c) Respondent's compliance program at the time of the inspection contained an anticipated installation date of the 4th quarter of 1977. The equipment has been ordered and Respondent anticipates installation in the 3rd quarter of 1978.

CITATION 3 - SERIOUS

| Violation | Abatement Date | Penalty |
|---|---|---|
| 1a<br>29 CFR 1910.134(f)(2)(i) as adopted by 1910.1029(g)(3): All respirators were not inspected routinely before and after each use:<br><br>a) Coke oven batteries #1 and #2 | 9/22/77 | $1,000 |

Stipulation

No stipulation as to Item 1a of Citation No. 3.

| Violation | Abatement Date | Penalty |
|---|---|---|
| 1b<br>29 CFR 1910.134(f)(3) as adopted by 1910.1029(g)(3): Routinely used respirators were not collected, cleaned, and disinfected as frequently as necessary to insure that proper protection was provided for the wearer:<br><br>a) Coke oven batteries #1 and #2 -- no provisions were made for collection and no cleaning and disinfection agents were provided | 9/22/77 | |

Stipulation

1. Each employee was responsible for cleaning his or her individual respirator.

2. As a result, Respondent made no provision for collecting the respirators at the time of the inspection.

3. Calgon Lotion soap was available to employees.

4. The abatement date in the citation is reasonable.

| Violation | Abatement Date | Penalty |
|---|---|---|
| 1c<br>29 CFR 1910.1029(g)(2)(i): In the vicinity of visible emissions, where respirators were required under this section, the employer did not select and assure the use of the appropriate respirator from Table 1:<br><br>a) Coke side of batteries #1 and #2 -- use by door machine operator not assured<br><br>b) Topside of Battery #1 -- use by larry car operator not assured<br><br>c) Topside of batteries #1 and #2 -- appropriate respirator for airborne concentrations of coke oven emissions greater than 1500 micrograms per cubic meter not selected for Lidman | 9/22/77 | |

Stipulation

1. The parties agree to the deletion of subsection c) of Item 1c.

| Violation | Abatement Date | Penalty |
|---|---|---|
| 2<br>29 CFR 1910.1029(h)(2)(vi); Persons who cleaned or laundered protective clothing required by this section were not informed of the potentially harmful effects of exposure to coke oven emissions:<br><br>a) Families of employees on coke oven batteries #1 and #2<br><br>b) Employees of Arrow Uniform Services Division of Work Wear Corporation | 9/22/77 | $1,000 |

Stipulation

1. During the period from January 20, 1977 to April 2, 1977 some of the employees took their clothing home or to other locations off plant property to launder it.

2. On April 3, 1977, pursuant to contract with Respondent, Arrow Uniform Service, Division of Work-Wear Division laundered coke oven employees' "protective clothing".

3. In the purchase order attached hereto, Respondent stated the following concerning the potentially harmful effects of exposure to coke oven emissions:

STANDING ORDER

FOR LAUNDERING AND REPAIR OF SUCH QUANTITIES OF

USS SPEC FLAME RESISTANT PANTS
USS SPEC FLAME RESISTANT JACKETS

SEW ALL HOLES AND PATCH, IF NECESSARY, FROM 1-20-77 TO 2-28-78 OR UNTIL NOTIFICATION OF CANCELLATION BY UNITED STATES STEEL CORP PRIOR TO 2-28-78.

ALL PURCHASES TO BE BILLED AND ITEMIZED INCLUDING THE RELEASE NUMBERS ON THE INVOICE IN TRIPLICATE, ON THE 25TH OF EACH MONTH.

"VENDOR, AS AN INDEPENDENT CONTRACTOR, SHALL PROVIDE ALL SUPERVISION, LABOR, TOOLS, EQUIP., MATERIALS AND SUPPLIES, AND DO AND PERFORM ALL WORK AND/OR SERVICES NECESSARY FOR THE INPLANT PICKUP, HANDLING, LAUNDERING, REPAIR AND RETURN OF PROTECTIVE CLOTHING USED BY PURCHASER'S EMPLOYEES AS BELOW PROVIDED."

THIS ORDER IS NOTIFICATION TO VENDOR THAT THE PROTECTIVE CLOTHING TO BE LAUNDERED HAS BEEN USED IN REGULATED AREAS OF U.S. STEEL'S COKE OVEN OPERATIONS AND IS DESIGNATED CONTAMINATED FROM EXPOSURE TO COKE OVEN EMISSIONS AND MAY CAUSE POTENTIALLY HARMFUL EFFECTS SUCH AS DESCRIBED IN THE OSHA STANDARD COVERING COKE OVEN EMISSIONS (29 CFR #1910.1029), EFFECTIVE JANUARY 20, 1977.

EACH EMPLOYEE'S PROTECTIVE CLOTHING SHALL BE REMOVED AND CLEANED NO LESS FREQUENTLY THAN ONCE WEEKLY. USED CLOTHING FOR PICKUP AND LAUNDERING WILL BE CONTAINED IN SEPARATE CLOSED CONTAINERS SUCH AS SEALED PLASTIC BAGS. ALL PRECAUTIONARY AND IDENTIFYING MARKS AND LABELS ON SUCH CLOTHING AND CONTAINERS RESPECTING EMPLOYEE NAME, HANDLING AND EXPOSURE

OF SUCH CLOTHING TO COKE OVEN EMISSIONS SHALL BE RETAINED. VENDOR SHALL BE SOLELY RESPONSIBLE FOR THE PROPER CARE, HANDLING AND LAUNDERING OF SUCH PROTECTIVE CLOTHING AND RETURN OF THE SAME TO USS IN FULL COMPLIANCE WITH ALL CONDITIONS HEREOF AND LAWS AND REGULATIONS APPLICABLE THERETO.

VENDOR SHALL ALSO GIVE ITS EMPLOYEES NOTICE OF THE NATURE OF THE EXPOSURE OF THE CLOTHING COVERED BY THIS ORDER.

ALL PERMANENT FLAME-RESISTANT CLOTHING SHALL BE CLEANED IN A MANNER SO THAT FLAME-RESISTANT PROPERTIES ARE MAINTAINED AND NECESSARY REPAIRS MADE IN ORDER TO INSURE EFFECTIVENESS OF SUCH GARMENT. ALL PANTS AND JACKETS WILL BE IDENTIFIED WITH EMPLOYEE NAME.

| Violation | Abatement Date | Penal' 7 |
|---|---|---|
| 3<br>29 CFR 1910.1029(i)(3): Lunchroom facilities which the employer provided did not have a temperature controlled, positive pressure, filtered air supply:<br><br>a) Old "lunchroom" located at bench level between coke oven batteries #1 and #2 | 10/15/77 | $1,000 |

---

3 (Abatement date modified) as amended 10/3/77 — 3/1/78

Stipulation

1. The "Old" lunchroom was located in the regulated area between batteries #1 and #2 at the bench level.

2. The New lunchroom which replaced the old lunch room on May 20, 1977 is located in the regulated area between batteries #1 and #2 at the bench level.

3. The Old lunchroom did not have postive-pressure, temperature controlled filterd air at the time of the inspection.

4. It is technically feasible to install such a system for the New lunchroom

5. Respondent's compliance program at the time of the inspection contained an anticipated installation date of the 3rd quarter of 1977. Respondent has revised its anticipated installation date to the 3rd quarter of 1978.

| Violation | Abatement Date | Penalty |
|---|---|---|
| 4<br>29 CFR 1910.1029(i)(4)(i): Employees working in the regulated area did not wash their hands and face prior to eating:<br><br>a) Employees on coke oven batteries #1 and #2 | 9/22/77 | $1,000 |

Stipulation

1. Facilities for washing are available in the lunchroom and in two lockerooms and two lavatories.

2. Respondent's training Program dated 1/7/77, revised 1/14/77, on page 11 states the following:

Slide 38
-Wash hands & Face-

There is one further point that must be emphasized about eating or drinking anything except water. After being in a regulated area,[38] the regutions require washing hands and face before eating or drinking anything or using any tobacco product or chewing gum. Washing facilities in areas in or near lunchrooms, change rooms, shower rooms, etc. must be used to wash hands and face before eating or drinking anything except drinking water.

Another thing to remember - in order to avoid skin irritation, you should wash your face and respirator facepiece as required.

| Violation | Abatement Date | Penalty |
|---|---|---|
| 5<br>29 CFR 1910.1029(i)(5)(i): The employer did not assure that in a regulated area food and beverages were not present or consumed or that smoking products were not present or used:<br><br>a) Old substandard "lunchroom" located at bench level between coke oven batteries #1 and #2 -- food present and consumed and smoking products present and used<br><br>b) Topside of coke oven batteries #1 and #2 -- smoking products present and used | 9/22/77 | $1,000 |

Stipulation

1. Employees were observed eating and smoking in the "old" lunchroom which is in the regulated area.

2. The "Old" lunchroom did not have positive-pressure temperature controlled filtered air.

3. Respondent's Training Program dated 1/7/77, revised 1/14/77, on page 10 states the following:

Although drinking water may be consumed in regulated areas,[36] the regulations prohibit employees from consuming any food or beverage except in a lunchroom, change room or shower room. The regulations also prohibit employees from taking any consummable item -- food or beverage -- into a

SLIDE 36
-No food, beverages, etc.

regulated area -- and this prohibition included chewing gum and tobacco products -- smoking tobacco, chewing tobacco and snuff. This may be a hard pill for long-time tobacco users to swallow, but these are government regulations and they must be enforced.

Unfortunately, the regulations also prohibit consumption of salt tablets or "pep-jels" in regulated areas. Since these items, in combination with drinking water, are very important due to exposure to heat, they will be readily available in lunchrooms and change rooms for use. To summarize,[37] the only thing that an employee is allowed to consume in a regulated area is drinking water -- nothing else. Because of this, make sure you increase your water intake while in the regulated area and be sure you get salt tablets or "pep-jels" regularly when you are in the lunchroom or change room.

SLIDE 37
-Water only-

Stipulation

1. Respondent's Training Program dated 1/7/77, revised 1/14/77, on pages 17, 18 and 19, states the following:

(52) Meetings such as this will be held annually starting in January, 1978. During 1977 there will be quarterly meetings. Training will also be provided for all new employees in the regulated areas.

Slide 52 -Information & Training-

If you desire, copies of the standard are available for your review.

(53) Now, we will talk about engineering and work practice controls.

Slide 53 -Title-Engineering Work Practice Controls-

Engineering and work practice controls required under the Standards must be instituted as soon as possible, but not later than January 20, 1980.

(54) Engineering controls to comply with the Standards at Fairless are presented on this chart.

Slide 54 -Chart-Installatior Engineering Control

(55) The Company is required to provide facilities with filtered and tempered air.

SLIDE 55
-Filtered Conditioned Requirements

(56) The filtered air installation dates for Fairless Works are shown on this chart. These dates are tentative.

SLIDE 56
-Chart-Installation for filtered air-

(57) Engineering controls for the charging procedure include:

SLIDE 57
-Engineering Controls Charging-

a. Devise for rapid and continuous flow of coal into oven (stainless steel liners).

b. Individual operated larry car drop sleeves.

c. Air seals on pusher machine leveler bars.

d. Roof carbon cutters.

(58) Engineering controls during coking cycle include:

SLIDE 58
-Engineering Controls Coking-

a. Heat shields on door machine.

(59) There are certain work practice controls to comply with in the Standards. During the charging cycle these controls include:

SLIDE 59
-Work Practice Control Charging-

a. Inspection of roof carbon prior to each charge to provide adequate gas channels to collector mains.

b. Inspection steam aspiration prior to each charge for sufficient pressure and volume to remove gases from oven collector mains.

(60) Work Practice Controls during the coking cycle include the following

Slide 60
-Work Practice Control Coking-

a. Checking oven back pressure controls to maintain uniform pressure conditions in collecting mains.

b. Cleaning of oven and chuck doors and jambs each cycle.

c. An Inspection system and corrective action program to control door emissions.

(61) Work Practice Controls for pushing cycle include:

Slide 61
-Work Practice Control Pushing-

a. Inspect standpipe caps prior to each charge and clean and wet seal.

b. Inspect each lid for carbon removal and wet seal after each charge.

(62) Maintenance Work Practice Controls will include: written procedures and inspections which will maintain equipment in proper condition and replacement will be made where necessary.

Slide 62
-Work Practice Control Maintenance-

That concludes the formal presentation. We will now answer any questions you may have.

# APPENDIX B

# 1910.1029—COKE OVEN EMISSIONS

## (a) Scope and application.

This section applies to the control of employee exposure to coke oven emissions, except that this section shall not apply to working conditions with regard to which other Federal agencies exercise statutory authority to prescribe or enforce standards affecting occupational safety and health.

## (b) Definitions

For the purpose of this section: "Authorized person" means any person specifically authorized by the employer whose duties require the person to enter a regulated area, or any person entering such an area as a designated representative of employees for the purpose of exercising the opportunity to observe monitoring and measuring procedures under paragraph (n) of this section.

"Beehive oven" means a coke oven in which the products of carbonization other than coke are not recovered, but are released into the ambient air.

"Coke oven" means a retort in which coke is produced by the destructive distillation or carbonization of coal.

"Coke oven battery" means a structure containing a number of slot-type coke ovens.

"Coke oven emissions" means the benzene-soluble fraction of total particulate matter present during the destructive distillation or carbonization of coal for the production of coke.

"Director" means the Director, National Institute for Occupational Safety and Health, U.S. Department of Health, Education, and Welfare, or his or her designee.

"Emergency" means any occurrence such as, but not limited to, equipment failure which is likely to, or does, result in any massive release of coke oven emissions.

"Existing coke oven battery" means a battery in operation or under construction on January 20, 1977, and which is not a rehabilitated coke oven battery.

"Rehabilitated coke oven battery" means a battery which is rebuilt, overhauled, renovated, or restored such as from the pad up, after January 20, 1977.

"Secretary" means the Secretary of Labor, U.S. Department of Labor, or his or her designee.

"Stage charging" means a procedure by which a predetermined volume of coal in each larry car hopper is introduced into an oven such that no more than two hoppers are discharging simultaneously.

"Sequential charging" means a procedure, usually automatically timed, by which a predetermined volume of coal in each larry car hopper is introduced into an oven such that no more than two hoppers commence or finish discharging simultaneously although, at some point, all hoppers are discharging simultaneously.

"Pipeline charging" means any apparatus used to introduce coal into an oven which uses a pipe or duct permanently mounted onto an oven and through which coal is charged.

"Green push" means coke which when removed from the oven results in emissions due to the presence of unvolatilized coal.

## (c) Permissible exposure limit.

The employer shall assure that no employee in the regulated area is exposed to coke oven emissions at concentrations greater than 150 micrograms per cubic meter of air (150 $\mu g/m^3$), averaged over any 8-hour period.

## (d) Regulated areas.

(1) The employer shall establish regulated areas and shall limit access to them to authorized persons.

(2) The employer shall establish the following as regulated areas:

(i) The coke oven battery including topside and its machinery, pushside and its machinery, coke side and its machinery, and the battery ends; the wharf; and the screening station;

(ii) The beehive oven and its machinery.

**(e) Exposure monitoring and measurement.**

**(1) Monitoring program.**

(i) Each employer who has a place of employment where coke oven emissions are present shall monitor employees employed in the regulated area to measure their exposure to coke oven emissions.

(ii) The employer shall obtain measurements which are representative of each employee's exposure to coke oven emissions over an eight-hour period. All measurements shall determine exposure without regard to the use of respiratory protection.

(iii) The employer shall collect full-shift (for at least seven continuous hours) personal samples, including at least one sample during each shift for each battery and each job classification within the regulated areas including at least the following job classifications:

(a) Lidman;

(b) Tar chaser;

(c) Larry car operator;

(d) Luterman;

(e) Machine operator, coke side;

(f) Benchman, coke side;

(g) Benchman, pusher side;

(h) Heater;

(i) Quenching car operator;

(j) Pusher machine operator;

(k) Screening station operator;

(l) Wharfman;

(m) Oven patcher;

(n) Oven repairman;

(o) Spellman; and

(p) Maintenance personnel.

(iv) The employer shall repeat the monitoring and measurements required by this paragraph (e)(1) at least every three months.

**(2) Redetermination.** Whenever there has been a production, process, or control change which may result in new or additional exposure to coke oven emissions, or whenever the employer has any other reason to suspect an increase in employee exposure, the employer shall repeat the monitoring and measurements required by paragraph (e)(1) of this section for those employees affected by such change or increase.

**(3) Employee notification.**

(i) The employer shall notify each employee in writing of the exposure measurements which represent that employee's exposure within five working days after the receipt of the results of measurements required by paragraphs (e)(1) and (e)(2) of this section.

(ii) Whenever such results indicate that the representative employee exposure exceeds the permissible exposure limit, the employer shall, in such notification, inform each employee of that fact and of the corrective action being taken to reduce exposure to or below the permissible exposure limit.

**(4) Accuracy of measurement.** The employer shall use a method of monitoring and measurement which has an accuracy (with a confidence level of 95%) of not less than plus or minus 35% for concentrations of coke oven emissions greater than or equal to 150 $\mu g/m^3$.

## (f) Methods of compliance.

The employer shall control employee exposure to coke oven emissions by the use of engineering controls, work practices and respiratory protection as follows:

### (1) Priority of compliance methods.

#### (i) Existing coke oven batteries.

(a) The employer shall institute the engineering and work practice controls listed in paragraphs (f)(2), (f)(3) and (f)(4) of this section in existing coke oven batteries at the earliest possible time, but not later than January 20, 1980, except to the extent that the employer can establish that such controls are not feasible. In determining the earliest possible time for institution of engineering and work practice controls, the requirement, effective August 27, 1971, to implement feasible administrative or engineering controls to reduce exposures to coal tar pitch volatiles, shall be considered. Wherever the engineering and work practice controls which can be instituted are not sufficient to reduce employee exposures to or below the permissible exposure limit, the employer shall nonetheless use them to reduce exposures to the lowest level achievable by these controls and shall supplement them by the use of respiratory protection which complies with the requirements of paragraph (g) of this section.

(b) The engineering and work practice controls required under paragraphs (f)(2), (f)(3) and (f)(4) of this section are minimum requirements generally applicable to all existing coke oven batteries. If, after implementing all controls required by paragraphs (f)(2), (f)(3) and (f)(4) of this section, or after January 20, 1980, whichever is sooner, employee exposures still exceed the permissible exposure limit, employers shall research, develop and implement any other engineering and work practice controls necessary to reduce exposure to or below the permissible exposure limit except to the extent that the employer can establish that such controls are not feasible. Wherever the engineering and work practice controls which can be instituted are not sufficient to reduce employee exposures to or below the permissible exposure limit, the employer shall nonetheless use them to reduce exposures to the lowest level achievable by these controls and shall supplement them by the use of respiratory protection which complies with the requirements of paragraph (g) of this section.

#### (ii) New or rehabilitated coke oven batteries.

(a) The employer shall institute the best available engineering and work practice controls on all new or rehabilitated coke oven batteries to reduce and maintain employee exposures at or below the permissible exposure limit, except to the extent that the employer can establish that such controls are not feasible. Wherever the engineering and work practice controls which can be instituted are not sufficient to reduce employee exposures to or below the permissible exposure limit, the employer shall nonetheless use them to reduce exposures to the lowest level achievable by these controls and shall supplement them by the use of respiratory protection which complies with the requirements of paragraph (g) of this section.

(b) If after implementing all the engineering and work practice controls required by paragraph (f)(1)(ii)(a) of this section, employee exposures still exceed the permissible exposure limit, the employer shall research, develop and implement any other engineering and work practice controls necessary to reduce exposure to or below the permissible exposure limit except to the extent that the employer can establish that such controls are not feasible. Wherever the engineering and work practice controls which can be instituted are not sufficient to reduce employee exposures to or below the permissible exposure limit, the employer shall nonetheless use them to reduce exposures to the lowest level achievable by these controls and shall supplement them by the use of respiratory protection which complies with the requirements of paragraph (g) of this section.

**(iii) Beehive ovens.**

(a) The employer shall institute engineering and work practice controls on all beehive ovens at the earliest possible time to reduce and maintain employee exposures at or below the permissible exposure limit, except to the extent that the employer can establish that such controls are not feasible. In determining the earliest possible time for institution of engineering and work practice controls, the requirement, effective August 27, 1971, to implement feasible administrative or engineering controls to reduce exposures to coal tar pitch volatiles, shall be considered. Wherever the engineering and work practice controls which can be instituted are not sufficient to reduce employee exposures to or below the permissible exposure limit, the employer shall nonetheless use them to reduce exposures to the lowest level achievable by these controls and shall supplement them by the use of respiratory protection which complies with the requirements of paragraph (g) of this section.

(b) If, after implementing all engineering and work practice controls required by paragraph (f) (1) (iii) (a) of this section, employee exposures still exceed the permissible exposure limit, the employer shall research, develop, and implement any other engineering and work practice controls necessary to reduce exposures to or below the permissible exposure limit except to the extent that the employer can establish that such controls are not feasible. Wherever the engineering and work practice controls which can be instituted are not sufficient to reduce employee exposures to or below the permissible exposure limit, the employer shall nonetheless use them to reduce exposures to the lowest level achievable by these controls and shall supplement them by the use of respiratory protection which complies with the requirements of paragraph (g) of this section.

**(2) Engineering controls.**

**(i) Charging.** The employer shall equip and operate existing coke oven batteries with all of the following engineering controls to control coke oven emissions during charging operations:

(a) One of the following methods of charging:

(1) Stage charging as described in paragraph (f)(3)(i)(b) of this section; or,

(2) Sequential charging as described in paragraph (f)(3)(i)(b) of this section except that paragraph (f)(3)(i)(b)(3)(iv) of this section does not apply to sequential charging; or

(3) Pipeline charging or other forms of enclosed charging in accordance with paragraph (f)(2)(i) of this section, except that paragraphs (f)(2)(i)(b), (d), (e), (f) and (h) of this section do not apply.

(b) Drafting from two or more points in the oven being charged, through the use of double collector mains, or a fixed or moveable jumper pipe system to another oven, to effectively remove the gases from the oven to the collector mains;

(c) Aspiration systems designed and operated to provide sufficient negative pressure and flow volume to effectively move the gases evolved during charging into the collector mains, including sufficient steam pressure, and steam jets of sufficient diameter;

(d) Mechanical volumetric controls on each larry car hopper to provide the proper amount of coal to be charged through each charging hole so that the tunnel head will be sufficient to permit the gases to move from the oven into the collector mains;

(e) Devices to facilitate the rapid and continuous flow of coal into the oven being charged, such as stainless steel liners, coal vibrators or pneumatic shells;

(f) Individually operated larry car drop sleeves and slide gates designed and maintained so that the gases are effectively removed from the oven into the collector mains;

(g) Mechanized gooseneck and standpipe cleaners;

(h) Air seals on the pusher machine leveler bars to control air infiltration during charging; and

(i) Roof carbon cutters or a compressed air system or both on the pusher machine rams to remove roof carbon.

**(ii) Coking.** The employer shall equip and operate existing coke oven batteries with all of the following engineering controls to control coke oven emissions during coking operations:

(a) A pressure control system on each battery to obtain uniform collector main pressure;

(b) Ready access to door repair facilities capable of prompt and efficient repair of doors, door sealing edges and all door parts;

(c) An adequate number of spare doors available for replacement purposes;

(d) Chuck door gaskets to control chuck door emissions until such door is repaired, or replaced; and

(e) Heat shields on door machines.

**(3) Work practice controls.**

**(i) Charging.** The employer shall operate existing coke oven batteries with all of the following work practices to control coke oven emissions during the charging operation:

(a) Establishment and implementation of a detailed, written inspection and cleaning procedure for each battery consisting of at least the following elements:

(1) Prompt and effective repair or replacement of all engineering controls;

(2) Inspection and cleaning of goosenecks and standpipes prior to each charge to a specified minimum diameter sufficient to effectively move the evolved gases from the oven to the collector mains;

(3) Inspection for roof carbon build-up prior to each charge and removal of roof carbon as necessary to provide an adequate gas channel so that the gases are effectively moved from the oven into the collector mains;

(4) Inspection of the steam aspiration system prior to each charge so that sufficient pressure and volume is maintained to effectively move the gases from the oven to the collector mains;

(5) Inspection of steam nozzles and liquor sprays prior to each charge and cleaning as necessary so that the steam nozzles and liquor sprays are clean;

(6) Inspection of standpipe caps prior to each charge and cleaning and luting or both as necessary so that the gases are effectively moved from the oven to the collector mains; and

(7) Inspection of charging holes and lids for cracks, warpage and other defects prior to each charge and removal of carbon to prevent emissions, and application of luting material to standpipe and charging hole lids where necessary to obtain a proper seal.

(b) Establishment and implementation of a detailed written charging procedure, designed and operated to eliminate emissions during charging for each battery, consisting of at least the following elements:

(1) Larry car hoppers filled with coal to a predetermined level in accordance with the mechanical volumetric controls required under paragraph (f)(2)(i)(d) of this section so as to maintain a sufficient gas passage in the oven to be charged;

(2) The larry car aligned over the oven to be charged, so that the drop sleeves fit tightly over the charging holes; and

(3) The oven charged in accordance with the following sequence of requirements:

(i) The aspiration system turned on;

(ii) Coal charged through the outermost hoppers, either individually or together, depending on the capacity of the aspiration system to collect the gases involved.

(iii) The charging holes used under paragraph (f)(3)(i)(b)(3)(ii) of this section relidded or otherwise sealed off to prevent leakage of coke oven emissions;

(iv) If four hoppers are used, the third hopper discharged and relidded or otherwise sealed off to prevent leakage of coke oven emissions;

(v) The final hopper discharged until the gas channel at the top of the oven is blocked and then the chuck door opened and the coal leveled;

(vi) When the coal from the final hopper is discharged and the leveling operation complete, the charging hole relidded or otherwise sealed off to prevent leakage of coke oven emissions; and

(vii) The aspiration system turned off only after the charging holes have been closed.

(c) Establishment and implementation of a detailed written charging procedure, designed and operated to eliminate emissions during charging of each pipeline or enclosed charged battery.

(ii) **Coking.** The employer shall operate existing coke oven batteries pursuant to a detailed written procedure established and implemented for the control of coke oven emissions during coking, consisting of at least the following elements:

(a) Checking oven back pressure controls to maintain uniform pressure conditions in the collecting main;

(b) Repair, replacement and adjustment of oven doors and chuck doors and replacement of door jambs so as to provide a continuous metal-to-metal fit;

(c) Cleaning of oven doors, chuck doors and door jambs each coking cycle so as to provide an effective seal;

(d) An inspection system and corrective action program to control door emissions to the maximum extent possible; and

(e) Luting of doors that are sealed by luting each coking cycle and reluting, replacing or adjusting as necessary to control leakage.

(iii) **Pushing.** The employer shall operate existing coke oven batteries with the following work practices to control coke oven emissions during pushing operations:

(a) Coke and coal spillage quenched as soon as practicable and not shoveled into a heated oven; and

(b) A detailed written procedure for each battery established and implemented for the control of emissions during pushing consisting of the following elements:

(1) Dampering off the ovens and removal of charging hole lids to effectively control coke oven emissions during the push;

(2) Heating of the coal charge uniformly for a sufficient period so as to obtain proper coking including preventing green pushes;

(3) Prevention of green pushes to the maximum extent possible;

(4) Inspection, adjustment and correction of heating flue temperatures and defective flues at least weekly and after any green push, so as to prevent green pushes;

(5) Cleaning of heating flues and related equipment to prevent green pushes, at least weekly and after any green push.

(iv) **Maintenance and repair.** The employer shall operate existing coke oven batteries pursuant to a detailed written procedure of maintenance and repair established and implemented for the effective control of coke oven emissions consisting of the following elements:

(a) Regular inspection of all controls, including goosenecks, standpipes, standpipe caps, charging hole lids and castings, jumper pipes and air seals for cracks, misalignment or other defects and prompt implementation of the necessary repairs as soon as possible;

(b) Maintaining the regulated area in a neat, orderly condition free of coal and coke spillage and debris;

(c) Regular inspection of the damper system, aspiration system and collector main for cracks or leakage, and prompt implementation of the necessary repairs;

(d) Regular inspection of the heating system and prompt implementation of the necessary repairs;

(e) Prevention of miscellaneous fugitive topside emissions;

(f) Regular inspection and patching of oven brickwork;

(g) Maintenance of battery equipment and controls in good working order;

(h) Maintenance and repair of coke oven doors, chuck doors, door jambs and seals; and

(i) Repairs instituted and completed as soon as possible, including temporary repair measures instituted and completed where necessary, including but not limited to:

(1) Prevention of miscellaneous fugitive topside emissions; and

(2) Chuck door gaskets, which shall be installed prior to the start of the next coking cycle.

(4) **Filtered air.**

(i) The employer shall provide positive-pressure, temperature controlled filtered air for larry car, pusher machine, door machine, and quench car cabs.

(ii) The employer shall provide standby pulpits on the battery topside, at the wharf, and at the screening station, equipped with positive-pressure, temperature controlled filtered air.

(5) **Emergencies.** Whenever an emergency occurs, the next coking cycle may not begin until the cause of the emergency is determined and corrected, unless the employer can establish that it is necessary to initiate the next coking cycle in order to determine the cause of the emergency.

(6) **Compliance program.**

(i) Each employer shall establish and implement a written program to reduce exposures solely by means of the engineering and work practice controls required in paragraph (f) of this section.

(ii) The written program shall include at least the following:

(a) A description of each coke oven operation by battery, including work force and operating crew, coking time, operating procedures and maintenance practices;

(b) Engineering plans and other studies used to determine the controls for the coke battery;

(c) A report of the technology considered in meeting the permissible exposure limit;

(d) Monitoring data obtained in accordance with paragraph (e) of this section;

(e) A detailed schedule for the implementation of the engineering and work practice

controls specified in paragraph (f) of this section; and

(f) Other relevant information.

(iii) If, after implementing all controls required by paragraphs (f)(2)–(f)(4) of this section, or after January 20, 1980, whichever is sooner, or after completion of a new or rehabilitated battery the permissible exposure limit is still exceeded, the employer shall develop a detailed written program and schedule for the development and implementation of any additional engineering controls and work practices necessary to reduce exposure to or below the permissible exposure limit.

(iv) Written plans for such programs shall be submitted, upon request, to the Secretary and the Director, and shall be available at the worksite for examination and copying by the Secretary, the Director, and the authorized employee representative. The plans required under paragraph (f)(6) of this section shall be revised and updated at least every six months to reflect the current status of the program.

**(7) Training in compliance procedures.** The employer shall incorporate all written procedures and schedules required under this paragraph (f) in the information and training program required under paragraph (k) of this section and, where appropriate, post in the regulated area.

**(g) Respiratory protection.**

**(1) General.**

(i) Where respiratory protection is required under this section, the employer shall provide and assure the use of respirators which comply with the requirements of this paragraph (g) Compliance with the permissible exposure limit may not be achieved by the use of respirators except:

(a) During the time period necessary to install or implement feasible engineering and work practice controls; or

(b) In work operations such as maintenance and repair activity in which engineering and work practice controls are technologically not feasible; or

(c) In work situations where feasible engineering and work practice controls are not yet sufficient to reduce exposure to or below the permissible exposure limit; or

(d) In emergencies.

(ii) Notwithstanding any other requirement of this section, until January 20, 1978, the wearing of respirators shall be at the discretion of each employee where the employee is not in the vicinity of visible emissions.

**(2) Selection.**

(i) Where respirators are required under this section, the employer shall select, provide and assure the use of the appropriate respirator or combination of respirators from Table I below.

TABLE I
RESPIRATORY PROTECTION FOR COKE OVEN EMISSIONS

| *Airborne concentration of coke oven emissions* | *Required respirator* |
|---|---|
| (a) Any concentration. | (1) A Type C supplied air respirator operated in pressure demand or other positive pressure or continuous flow mode; or<br>(2) A powered air-purifying particulate filter respirator for dust, and mist;<br>(3) A powered air-purifying particulate filter respirator or combination chemical cartridge and particulate filter respirator for coke oven emissions. |
| (b) Concentrations not greater than 1500 $\mu g/m^3$. | (1) Any particulate filter respirator for dust and mist, except single-use respirator; or<br>(2) Any particulate filter respirator or combination chemical cartridge and particulate filter respirator for coke oven emissions; or<br>(3) Any respirator listed in paragraph (g)(2)(i)(a) of this section. |

(ii) Not later than January 20, 1978, whenever respirators are required by this section for concentrations not greater than 1500 $\mu g/m^3$, the employer shall provide, at the option of each affected employee, either a particulate filter respirator as provided in paragraph (g)(2)(i)(b) of this section, or a powered air purifying respirator as provided in paragraph (g)(2)(i)(a) of this section.

(iii) The employer shall select respirators from among those approved for protection against dust and mist by the National Institute for Occupational Safety and Health (NIOSH) under the provisions of 30 CFR Part II, except that not later than January 20, 1979, the employer shall select respirators from among those approved by NIOSH for protection against coke oven emissions.

(3) **Respirator program.** The employer shall institute a respiratory protection program in accordance with §1910.134 of this part.

(4) **Respirator usage.**

(i) The employer shall assure that the respirator issued to the employee exhibits minimum facepiece leakage and that the respirator is fitted properly. The employer shall perform quantitative fit tests annually for each employee who uses a nonpowered, particulate filter respirator.

(ii) The employer shall allow each employee who uses a filter respirator to change the filter elements whenever an increase in breathing resistance is detected and shall maintain an adequate supply of filter elements for this purpose.

(iii) The employer shall allow employees who wear respirators to wash their face and respirator facepiece to prevent skin irritation associated with respirator use.

## (h) Protective clothing and equipment.

(1) **Provision and use.** The employer shall provide and assure the use of appropriate protective clothing and equipment, such as but not limited to:

(i) Flame resistant jacket and pants;

(ii) Flame resistant gloves;

(iii) Face shields or vented goggles which comply with §1910.133(a)(2) of this part;

(iv) Insulation from hot surfaces for footwear;

(v) Safety shoes which comply with §1910.136 of this part; and

(vi) Protective helmets which comply with §1910.135 of this part.

(2) **Cleaning and replacement.**

(i) The employer shall provide the protective clothing required by paragraphs (h)(1)(i) and (ii) of this section in a clean and dry condition at least weekly.

(ii) The employer shall clean, launder, or dispose of protective clothing required by paragraphs (h)(1)(i) and (ii) of this section.

(iii) The employer shall repair or replace the protective clothing and equipment as needed to maintain their effectiveness.

(iv) The employer shall assure that all protective clothing is removed at the completion of a work shift only in change rooms prescribed in paragraph (i)(1) of this section.

(v) The employer shall assure that contaminated protective clothing which is to be cleaned, laundered, or disposed of, is placed in a closable container in the change room.

(vi) The employer shall inform any person who cleans or launders protective clothing required by this section, of the potentially harmful effects of exposure to coke oven emissions.

## (i) Hygiene facilities and practices.

(1) **Change rooms.** The employer shall provide clean change rooms equipped with storage facilities for street clothes and separate storage facilities for protective clothing and

equipment whenever employees are required to wear protective clothing and equipment in accordance with paragraph (h)(1) of this section.

**(2) Showers.**

(i) The employer shall assure that employees working in the regulated area shower at the end of the work shift.

(ii) The employer shall provide shower facilities in accordance with §1910.141 (d)(3) of this Part.

**(3) Lunchrooms.** The employer shall provide lunchroom facilities which have a temperature controlled, positive pressure, filtered air supply, and which are readily accessible to employees working in the regulated area.

**(4) Lavatories.**

(i) The employer shall assure that employees working in the regulated area wash their hands and face prior to eating.

(ii) The employer shall provide lavatory facilities in accordance with §1910.141(d)(1) and (2) of this Part.

**(5) Prohibition of activities in the regulated area.**

(i) The employer shall assure that in the regulated area, food or beverages are not present or consumed, smoking products are not present or used, and cosmetics are not applied, except, that these activities may be conducted in the lunchrooms, change rooms and showers required under paragraphs (i)(1)—(i)(3) of this section.

(ii) Drinking water may be consumed in the regulated area.

## (j) Medical surveillance.

**(1) General requirements.**

(i) Each employer shall institute a medical surveillance program for all employees who are employed in a regulated area at least 30 days per year.

(ii) This program shall provide each employee covered under paragraph (j)(1)(i) of this section with an opportunity for medical examinations in accordance with this paragraph (j).

(iii) The employer shall inform any employee who refuses any required medical examination of the possible health consequences of such refusal and shall obtain a signed statement from the employee indicating that the employee understands the risk involved in the refusal to be examined.

(iv) The employer shall assure that all medical examinations and procedures are performed by or under the supervision of a licensed physician, and are provided without cost to the employee.

**(2) Initial examinations.** At the time of initial assignment to a regulated area or upon the institution of the medical surveillance program, the employer shall provide a medical examination for employees covered under paragraph (j)(1)(i) of this section including at least the following elements:

(i) A work history and medical history which shall include smoking history and the presence and degree of respiratory symptoms, such as breathlessness, cough, sputum production, and wheezing;

(ii) A 14" × 17" posterior-anterior chest x-ray and International Labour Office UICC/Cincinnati (ILO U/C) rating;

(iii) Pulmonary function tests including forced vital capacity (FVC) and forced expiratory volume at one second (FEV 1.0) with recording of type of equipment used;

(iv) Weight;

(v) A skin examination;

(vi) Urinalysis for sugar, albumin, and hematuria;

(vii) A sputum cytology examination; and

(viii) A urinary cytology examination.

**(3) Periodic examinations.**

(i) The employer shall provide the examinations specified in paragraphs (j)(2)(i)—(vi) of this section at least annually for employees covered under paragraph (j)(1)(i) of this section.

(ii) The employer shall provide the examinations specified in paragraphs (j)(2)(i)—(viii) of this section at least semi-annually for employees 45 years of age or older or with five (5) or more years employment in the regulated area.

(iii) Whenever an employee who is 45 years of age or older or with five (5) or more years employment in the regulated area transfers or is transferred from employment in a regulated area, the employer shall continue to provide the examinations specified in paragraphs (j)(2)(i)—(viii) of this section semi-annually, as long as that employee is employed by the same employer or a successor employer.

(iv) Whenever an employee has not taken the examinations specified in paragraphs (j)(3)(i)—(iii) of this section within the six (6) months preceding the termination of employment, the employer shall provide such examinations to the employee upon termination of employment.

**(4) Information provided to the physician.** The employer shall provide the following information to the examining physician:

(i) A copy of this regulation and its Appendixes;

(ii) A description of the affected employee's duties as they relate to the employee's exposure;

(iii) The employee's exposure level or estimated exposure level;

(iv) A description of any personal protective equipment used or to be used; and

(v) Information from previous medical examinations of the affected employee which is not readily available to the examining physician.

**(5) Physician's written opinion.**

(i) The employer shall obtain a written opinion from the examining physician which shall include:

(a) The results of the medical examinations;

(b) The physician's opinion as to whether the employee has any detected medical conditions which would place the employee at increased risk of material impairment of the employee's health from exposure to coke oven emissions;

(c) Any recommended limitations upon the employee's exposure to coke oven emissions or upon the use of protective clothing or equipment such as respirators; and

(d) A statement that the employee has been informed by the physician of the results of the medical examination and any medical conditions which require further explanation or treatment.

(ii) The employer shall instruct the physician not to reveal in the written opinion specific findings or diagnoses unrelated to occupational exposure.

(iii) The employer shall provide a copy of the written opinion to the affected employee.

## (k) Employee information and training.

**(1) Training program.**

(i) The employer shall institute a training program for employees who are employed in the regulated area and shall assure their participation.

(ii) The training program shall be provided as of January 27, 1977 for employees who are employed in the regulated area at that time or at the time of initial assignment to a regulated area.

(iii) The training program shall be provided at least annually for all employees who are employed in the regulated area, except that training regarding the occupational safety and health hazards associated with exposure to coke oven emissions and the purpose, proper use, and limitations of respiratory protective devices shall be provided at least quarterly until January 20, 1978.

(iv) The training program shall include informing each employee of:

(a) The information contained in the substance information sheet for coke oven emissions (Appendix A);

(b) The purpose, proper use, and limitations of respiratory protective devices required in accordance with paragraph (g) of this section;

(c) The purpose for and a description of the medical surveillance program required by paragraph (j) of this section including information on the occupational safety and health hazards associated with exposure to coke oven emissions;

(d) A review of all written procedures and schedules required under paragraph (f) of this section; and

(e) A review of this standard.

**(2) Access to training materials.**

(i) The employer shall make a copy of this standard and its appendixes readily available to all employees who are employed in the regulated area.

(ii) The employer shall provide upon request all materials relating to the employee information and training program to the Secretary and the Director.

## (l) Precautionary signs and labels.

**(1) General.**

(i) The employer may use labels or signs required by other statutes, regulations or ordinances in addition to, or in combination with signs and labels required by this paragraph.

(ii) The employer shall assure that no statement appears on or near any sign required by this paragraph which contradicts or detracts from the effects of the required sign.

(iii) The employer shall assure that signs required by this paragraph are illuminated and cleaned as necessary so that the legend is readily visible.

**(2) Signs.**

(i) The employer shall post signs in the regulated area bearing the legends:

DANGER

CANCER HAZARD

AUTHORIZED PERSONNEL ONLY

NO SMOKING OR EATING

(ii) In addition, not later than January 20, 1978, the employer shall post signs in the areas where the permissible exposure limit is exceeded bearing the legend:

DANGER

RESPIRATOR REQUIRED

**(3) Labels.** The employer shall apply precautionary labels to all containers of protective clothing contaminated with coke oven emissions bearing the legend:

CAUTION

CLOTHING CONTAMINATED WITH COKE EMISSIONS

DO NOT REMOVE DUST BY BLOWING OR SHAKING

**(m) Recordkeeping.**

**(1) Exposure measurements.** The employer shall establish and maintain an accurate record of all measurements taken to monitor employee exposure to coke oven emissions required in paragraph (e) of this section.

(i) This record shall include:

(a) Name, social security number, and job classification of the employees monitored;

(b) The date(s), number, duration and results of each of the samples taken, including a description of the sampling procedure used to determine representative employee exposure where applicable;

(c) The type of respiratory protective devices worn, if any;

(d) A description of the sampling and analytical methods used and evidence of their accuracy; and

(e) The environmental variables that could affect the measurement of employee exposure.

(ii) The employer shall maintain this record for at least 40 years or for the duration of employment plus 20 years, whichever is longer.

**(2) Medical surveillance.** The employer shall establish and maintain an accurate record for each employee subject to medical surveillance as required by paragraph (j) of this section.

(i) The record shall include:

(a) The name, social security number, and description of duties of the employee;

(b) A copy of the physician's written opinion;

(c) The signed statement of any refusal to take a medical examination under paragraph (j)(1)(ii) of this section; and

(d) Any employee medical complaints related to exposure to coke oven emissions.

(ii) The employer shall keep, or assure that the examining physician keeps, the following medical records:

(a) A copy of the medical examination results including medical and work history required under paragraph (j)(2) of this section;

(b) A description of the laboratory procedures used and a copy of any standards or guidelines used to interpret the test results;

(c) The initial x-ray;

(d) The x-rays for the most recent 5 years;

(e) Any x-ray with a demonstrated abnormality and all subsequent x-rays;

(f) The initial cytologic examination slide and written description;

(g) The cytologic examination slide and written description for the most recent 10 years; and

(h) Any cytologic examination slides with demonstrated atypia, if such atypia persists for 3 years, and all subsequent slides and written descriptions.

(iii) The employer shall maintain medical records required under paragraph (m)(2) of this section for at least 40 years, or for the duration of employment plus 20 years, whichever is longer.

**(3) Availability.**

(i) The employer shall make available upon request all records required to be maintained by paragraph (m) of this section to the Secretary and the Director for examination and copying.

(ii) The employer shall make available upon request records of employee exposure measurements required by paragraph (m)(1) of this section for inspection and copying to affected employees, and their designated representatives.

(iii) The employer shall make available upon request employee medical records required to be maintained by paragraph (m)(2) of this section to a physician designated by the affected employee or former employee.

(iv) The employer shall make available upon request records of employee exposure measurements required by paragraph (m)(1) of this section for inspection and copying to former employees and their designated representatives which indicate the former employees own exposures.

**(4) Transfer of records.**

(i) Whenever the employer ceases to do business, the successor employer shall receive and retain all records required to be maintained by paragraph (m) of this section.

(ii) Whenever the employer ceases to do business and there is no successor employer to receive and retain the records for the prescribed period, these records shall be transmitted by registered mail to the Director.

(iii) At the expiration of the retention period for the records required to be maintained under paragraphs (m)(1) and (m)(2) of this section, the employer shall transmit these records by registered mail to the Director or shall continue to retain such records.

## (n) Observation of monitoring.

**(1) Employee observation.** The employer shall provide affected employees or their representatives an opportunity to observe any measuring or monitoring of employee exposure to coke oven emissions conducted pursuant to paragraph (e) of this section.

**(2) Observation procedures.**

(i) Whenever observation of the measuring or monitoring of employee exposure to coke oven emissions requires entry into an area where the use of protective clothing or equipment is required, the employer shall provide the observer with and assure the use of such equipment and shall require the observer to comply with all other applicable safety and health procedures.

(ii) Without interfering with the measurement, observers shall be entitled to:

(a) An explanation of the measurement procedures;

(b) Observe all steps related to the measurement of coke oven emissions performed at the place of exposure; and

(c) Record the results obtained.

## (o) Effective date.

This standard shall become effective January 20, 1977.

## (p) Appendixes.

The information contained in the appendixes to this section is not intended, by itself, to create any additional obligations not otherwise imposed or to detract from any existing obligation.

### APPENDIX A—COKE OVEN EMISSIONS SUBSTANCE INFORMATION SHEET

#### I. SUBSTANCE IDENTIFICATION

A. *Substance:* Coke Oven Emissions

B. *Definition:* The Benzene-soluble fraction of total particulate matter present during the destructive distillation or carbonization of coal for the production of coke.

C. *Permissible Exposure Limit:* 150 micrograms per cubic meter of air determined as an average over 8-hour period.

D. *Regulated areas:* Only employees authorized by your employer should enter a regulated area. The employer is required to designate the following areas as regulated areas: the coke oven battery, including topside and its machinery, pushside and its machinery, cokeside and its machinery, and the battery ends: the screening station; the wharf; and the beehive ovens and their machinery.

#### II. HEALTH HAZARD DATA

Exposure to coke oven emissions is a cause of lung cancer, and kidney cancer, in humans. Although there have not been an excess number of skin cancer cases in humans, repeated skin contact with coke oven emissions should be avoided.

III. PROTECTIVE CLOTHING AND EQUIPMENT

A. *Respirators:* Respirators will be provided by your employer for routine use if your employer is in the process of implementing engineering and work practice controls or where engineering and work practice controls are not feasible or insufficient to reduce exposure to or below the PEL. You must wear respirators for non-routine activities or in emergency situations where you are likely to be exposed to levels of coke oven emissions in excess of the permissible exposure limit. Until January 20, 1978, the routine wearing of respirators is voluntary. Until that date, if you choose not to wear a respirator you do not have to do so. You must still have your respirator with you and you must still wear it if you are near visible emissions. Since how well your respirator fits your face is very important, your employer is required to conduct fit tests to make sure the respirator seals properly when you wear it. These tests are simple and rapid and will be explained to you during your training sessions.

B. *Protective clothing:* Your employer is required to provide, and you must wear, appropriate, clean, protective clothing and equipment to protect your body from repeated skin contact with coke oven emissions and from the heat generated during the coking process. This clothing should include such items as jacket and pants and flame resistant gloves. Protective equipment should include face shield or vented goggles, protective helmets and safety shoes, insulated from hot surfaces where appropriate.

IV. HYGIENE FACILITIES AND PRACTICES

You must not eat, drink, smoke, chew gum or tobacco, or apply cosmetics in the regulated area, except that drinking water is permitted. Your employer is required to provide lunchrooms and other areas for these purposes.

Your employer is required to provide showers, washing facilities, and change rooms. If you work in a regulated area, you must wash your face, and hands before eating. You must shower at the end of the work shift. Do not take used protective clothing out of the change rooms without your employer's permission. Your employer is required to provide for laundering or cleaning of your protective clothing.

V. SIGNS AND LABELS

Your employer is required to post warning signs and labels for your protection. Signs must be posted in regulated areas. The signs must warn that a cancer hazard is present, that only authorized employees may enter the area, and that no smoking or eating is allowed. In regulated areas where coke oven emissions are above the permissible exposure limit, the signs should also warn that respirators must be worn.

VI. MEDICAL EXAMINATIONS

If you work in a regulated area at least 30 days per year, your employer is required to provide you with a medical examination every year. The medical examination must include a medical history, a chest x-ray; pulmonary function test; weight comparison; skin examination; a urinalysis and a urine and sputum cytology exam for the early detection of urinary or lung cancer. The cytology exams are only included in the initial exam until you are either 45 years or older or have 5 or more years employment in the regulated areas when the medical exams including these tests are to be given every 6 months. The examining physician will provide a written opinion to your employer containing the results of the medical exams. You should also receive a copy of this opinion.

VII. OBSERVATION OF MONITORING

Your employer is required to monitor your exposure to coke oven emissions and you are entitled to observe the monitoring procedure. You are entitled to receive an explanation of the measurement procedure, observe the steps taken in the measurement procedure, and to record the results obtained. When the monitoring procedure is taking place in an area where respirators or personal protective clothing and equipment are required to be worn, you must also be provided with and must wear the protective clothing and equipment.

VIII. ACCESS TO RECORDS

You or your representative are entitled to records of your exposure to coke oven emissions upon request to your employer. Your medical examination records can be furnished to your physician upon request to your employer.

IX. TRAINING AND EDUCATION

Additional information on all of these items plus training as to hazards of coke oven emissions and the engineering and work practice controls associated with your job will also be provided by your employer.

## APPENDIX B—INDUSTRIAL HYGIENE AND MEDICAL SURVEILLANCE GUIDELINES

I. INDUSTRIAL HYGIENE GUIDELINES

A. *Sampling.* (Benzene-Soluble Fraction Total Particulate Matter).

Samples collected should be full shift (at least 7-hour) samples. Sampling should be done using a personal sampling pump with pulsation damper at a flow rate of 2 liters per minute. Samples should be collected on 0.8 micrometer pore size silver membrane filters (37 mm diameter) preceded by Gelman glass fiber type A-E filters encased in three-piece plastic (polystyrene) field monitor cassettes. The cassette face cap should be on and the plug removed. The rotameter should be checked every hour to ensure that proper flow rates are maintained.

A minimum of three full-shift samples should be collected for each job classification on each battery, at least one from each shift. If disparate results are obtained for particular job classification, sampling should be repeated. It is advis-

able to sample each shift on more than one day to account for environmental variables (wind, precipitation, etc.) which may affect sampling. Differences in exposures among different work shifts may indicate a need to improve work practices on a particular shift. Sampling results from different shifts for each job classification should not be averaged. Multiple samples from the same shift on each battery may be used to calculate an average exposure for a particular job classification.

B. *Analysis.*

1. All extraction glassware is cleaned with dichromic acid cleaning solution, rinsed with tap water, then dionized water, acetone, and allowed to dry completely. The glassware is rinsed with nanograde benzene before use. The Teflon cups are cleaned with benzene then with acetone.

2. Pre-weigh the 2 ml Teflon cups to one hundredth of a milligram (0.01 mg) on a autobalance AD 2 Tare weight of the cups is about 50 mg.

3. Place the silver membrane filter and glass fiber filter into a 15 ml test tube.

4. Extract with 5 ml of benzene for five mintues in an ultrasonic cleaner.

5. Filter the extract in 15 ml medium glass fritted funnels.

6. Rinse test tube and filters with two 1.5 ml aliquots of benzine and filter through the fritted glass funnel.

7. Collect the extract and two rinses in a 10 ml Kontes graduated evaporative concentrator.

8. Evaporate down to 1 ml while rinsing the sides with benzene.

9. Pipet 0.5 ml into the Teflon cup and evaporate to dryness in a vacuum oven at 40° C for 3 hours.

10. Weigh the Teflon cup and the weight gain is due to the benzene soluable residue in half the Sample.

II. MEDICAL SURVEILLANCE GUIDELINES

A. *General.*

The minimum requirements for the medical examination for coke oven workers are given in paragraph (j) of the standard.

The initial examination is to be provided to all coke oven workers who work at least 30 days in the regulated area. The examination includes at 14" × 17" posterior-anterior chest x-ray and a ILO/UC rating to assure some standardization of x-ray reading, pulmonary function tests (FVC and FEV 1.0), weight, urinalysis, skin examination and a sputum and urinary cytologic examination. These tests are to serve as the baseline for comparing the employee's future test results. Periodic exams include all the elements of the initial exams except that the cytologic tests need be performed only on those employees who are 45 years of age or older or who have worked for 5 or more years in the related area; periodic exams are to be performed semiannually for this group instead of annually. The examination contents are minimum requirements, additional tests such as lateral and oblique x-rays or additional pulmonary function tests may be performed if deemed necessary.

B. *Pulmonary function tests.*

Pulmonary function tests should be performed in a manner which minimizes subject and operator bias. There has been shown to be learning effects with regard to the results obtained from certain tests, such as FEV 1.0. Best results can be obtained by multiple trials for each subject. The best of three trials or the average of the last three of five trials may be used in obtaining reliable results. The type of equipment used (manufacturer, model, etc.) should be recorded with the results as reliability and accuracy varies and such information may be important in the evaluation of test results. Care should be exercised to obtain the best possible testing equipment.

C. *Sputum cytology.*

Sputum can be collected by aerosol inhalation during the medical exam or by spontaneous early morning cough at home. Sputum is induced by transoral inhalation of an aerosolized solution of eight per cent (8%) sodium chloride in water. After inhaling as few as three to five breaths the subject usually yields an adequate sputum specimen. A minimum of three samples should be collected by the subject at home. All sputum should be collected directly into sixty per cent (60%) alcohol.

Scientific evidence suggests that chest x-rays and sputum cytology should be used together as screening tests for lung cancer in high risk populations, such as coke oven workers. The tests are to be performed every six months on workers who are 45 years of age or older or have worked in the regulated area for 5 or more years. Since the tests seem to be complementary, it may be advantageous to alternate the test procedures. For instance, chest x-rays could be obtained in June and December and sputum cytologys should be obtained in March and September. Facilities for providing necessary diagnostic investigation should be readily available as well as chest physicians, surgeons, radiologists, pathologists, and immunotherapists to provide any necessary treatment services.

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

NOTICE OF DECISION

Secretary of Labor v. Core Oil and Gas Corp., Rig #11
OSHRC Docket No. 82-0562

1. Enclosed is a copy of my decision. It will be filed with the Commission on October 13, 1982, and will become the final order of the Commission on November 12, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is November 12, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

James A. Cronin, Jr.
Judge, OSHRC

Date: September 23, 1982

JUDGE'S DECISION
OCT 13 '82
RECEIVED
FINAL ORDER ON
NOV 19 '82

APPEARANCES:

Ronnie A. Howell, Esquire, of Dallas, Texas,
For the Complainant,

Robert G. Grove, Esquire of Oklahoma City, Oklahoma
For the Respondent.

DECISION AND ORDER

Cronin, Judge, OSHRC:

On March 17, 1982, a gas separator explosion killed an employee on Core Oil & Gas Corp's. Oil Rig No. 11. Following an investigation and inspection of the work site on March 18, 1982, by a compliance officer of the Occupational Safety and Health Administration (OSHA), the Secretary of Labor issued a citation to Core charging it with four "serious" violations and one "other than serious" violation of safety standards promulgated under the Occupational Safety and Health Act of 1970 (29 U.S.C. §651 et seq., hereafter called the "Act"). Citation No. 1 proposed a total penalty of $1440.00. Core contested the alleged violations and a hearing was held at Oklahoma City on July 28, 1982.

At the outset of the hearing the Secretary withdrew Citation No. 2 charging an "other than serious" violation, leaving at issue only the four alleged serious violations of Citation No. 1.

Item 1 of Citation No. 1 describes the alleged violation of 29 C.F.R. §1910.23(c)(1) as follows:

> Open sided floor(s) or platform(s) 4 feet or more above the adjacent floor or ground level were not guarded by standard railings (or the equivalent as specified in 29 CFR 1910.23(e)(3) through (v)), on all open sides:
>
> > Approximately 10 feet east of Shale Shaker, gas separator platform was not equippped with standard guard railing or the equivalent.

29 C.F.R. §1910.23(c)(1) provides:

> Guarding Floor and Wall Openings and Holes -
> (c) Protection of open-sided floors, platforms, and runways.
> (1) Every open-sided floor or platform 4 feet or more above adjacent floor or ground level shall be guarded by a standard railing (or the equivalent as specified in paragraph (e)(3) of this section) on all open sides, except where there is entrance to a ramp, stairway, or fixed ladder. The railing shall be provided with a toeboard wherever, beneath the open sides.

Item 2 of Citation No. 1 describes the alleged violation of 29 C.F.R. §1910.27(b)(1)(ii) as follows:

> The distances between rungs, cleats, or steps of fixed ladders was not uniform throughout the length of ladder:
>
> > Approximately 10 feet east of Shale Shaker on east side of gas separator tank platform, 10' in length fixed metal ladder separation, between rungs varied from six inches to four inches.

29 C.F.R. §1910.27(b)(1)(ii) provides:

> Fixed Ladders -
> (b) Specific features.
> (1) Rungs and cleats.
> (ii) The distance between rungs, cleats, and steps shall not exceed 12 inches and shall be uniform throughout the length of the ladder.

Item 3 of Citation No. 1 describes the alleged violation of 29 C.F.R. §1910.106(b)(6) as follows:

> Sources of ignition were not elimated or controlled where the presence of flammable vapors was possible:
>
> > Approximately 10 feet east of Shale Shaker, precautions were not taken to remove the source of ignition such as smoking, flare back through the air vent pipe (no flame arrester).

29 C.F.R. §1910.106(b)(6) provides:

> Flammable and combustible liquids -
> (b) Tank storage.
> (6) Sources of ignition. In locations where flammable vapors may be present, precautions shall be taken to prevent ignition by eliminating or controlling sources of ignition. Sources of ignition may include open flames, lightning, smoking, cutting and welding, hot surfaces, frictional heat, sparks (static, electrical, and mechanical), spontaneous ignition, chemical and physical-chemical reactions, and radiant heat.

Item 4 of Citation No. 1 describes the alleged violation of 29 C.F.R. §1910.106(f)(6) as follows:

> Class I flammable liquid(s) were handled, drawn, or dispensed where flammable vapor could reach a source of ignition:
>
> > Approximately 10 feet east of Shale Shaker, employee's will remove the gas separator port cover, where there is a high probability of flammable vapor present. The area is not marked by "NO SMOKING" signs.

29 C.F.R. §1910.106(f)(6) provides:

> Flammable and combustible liquids -
> (f) Bulk plants-
> (6) Sources of ignition. Class I liquids shall not be handled, drawn, or dispensed where flammable vapors may reach a source of ignition. Smoking shall be prohibited except in designated localities. "No Smoking" signs shall be conspicuously posted where hazard from flammable liquid vapors is normally present.

## Summary of Evidence

Core is a contract driller in the oil and gas exploration industry. On March 17, 1982, Core's Rig No. 11 was located on a drilling site in Wheeler County, Texas. Rig No. 11 has been at this site since just before New Year's day of 1982 (Tr. 131). About six weeks later a "gas separator" and its base platform arrived at the drill site and was connected to the rig immediately adjacent to the "shale shaker" (Tr. 104, 109). The above ground height of the adjustable gas separator platform was approximately 10 feet (Tr. 13, 18, 90). At the hearing the platform dimensions were variously estimated as "6 to 8 feet wide" and more than "35 feet" long, and "four and a half feet wide" and "approximately eight to ten feet long" (Tr. 83-84, 88, 131; Exhibits C-1, C-2).[1/]

The four sides of this platform were open and completely unguarded (Tr. 13; Exhibits C-1, C-2). On March 17, 1982, Core's Tool Pusher, Mr. Reeves, and Motor Man, Mr. Walker, worked on the platform cleaning out the gas separator (Tr. 126).

Two abutting ladders were welded to the gas separator platform and frame at its northeast corner, one ladder to the "top section," the other ladder to the "bottom section" (Tr. 27-30, 32, 90).

The telescoping design of the ladders permits the platform to be adjusted up or down without removing either of the fixed ladders (Tr. 90-91). The platform is customarily adjusted twice during the drilling stage - whenever the blowout preventers are changed (Tr. 109-111). No adjustment in the height of the platform had been made prior to March 18th, the date of the OSHA inspection (Tr. 111).

On March 18th, the rungs of the two abutting ladders (which constituted a single ladder for climbing) were not aligned and the distance between the rungs were not uniform (Tr. 27-31, 113). At one point the

---

1/ There was another suggestion by respondent's counsel (probably valid) that the platform was eight feet wide and 16 feet long (Tr. 131).

rungs of the exterior and interior ladders were two and a half to three inches apart. The spacing between the remaining rungs, for approximately four feet, varied from 4 to 6 inches (Tr. 113-116).

Tool Pusher Reeves climbed the ladder on March 17, 1982, to reach the platform and admits to using the ladder "several times" (Tr. 127). He further testified that the ladders were installed to permit access to the platform (Tr. 156-157). Although Mr. Hutton, Core's Safety Director, testified that the ladder was installed to provide an exit in case of an emergency, he concedes that the ladder also would be used as an access ladder to the platform (Tr. 176, 184).

In the opinion of the Secretary's compliance officer, Mr. Vigil, a person climbing this ladder would "automatically hit the uneven rungs" which in turn could cause a fall of up to 10 feet (Tr. 32, 54-56).

On March 17, 1982, flammable vapors from the gas separator ignited and exploded killing Core's Motor Man, Mr. Walker, At the time of the explosion, Mr. Walker was attempting to re-bolt the port or valve cover of the gas separator (Tr. 34-35). A "No Smoking" sign was posted in the shale shaker area - 10 feet from the gas separator, but no similar sign was posted on the gas separator.

The compliance officer suggests two possible sources of ignition which may have caused this explosion. Mr. Walker may have been smoking, or there may have been a "flash back" in the flare pipe (Tr. 34). In his view a "No Smoking" sign should have been posted on the gas separator, the employees trained not to smoke in that area, and steps taken to ensure that all flame in the flare pipe had been extinguished before removing the port cover of the gas separator (Tr. 38-39). The compliance officer further believes that either a "wedge" or a flame arrestor should have

been installed near the end of the flare pipe in order to eliminate any chance of a flare back or "wicking" action (Tr. 39).

The relevant facts leading up to the March 17th explosion are undisputed.

There are two ways customarily employed to clean a gas separator. The valve at the bottom of the eight inch pipe sometimes is opened to drain and flush the collected solids. This valve opens at ground level (Tr. 122-124). The other way, the "right way," to clean the gas separator is to remove the port cover and then wash it out with a water hose (Tr. 124).

On March 17th, just before 6:00 a.m., the gas separator was "taken off the line" by closing the valves to prevent any more "mud" or gas going through the gas separator. The five-gallon fire bucket, which hangs on the end of the flare pipe and is used to burn the gas discharged from the 6 inch gas flow pipe, then was removed. At that time, there was no fire in the bucket and no evidence of any flame at the end of the gas flow pipe (Tr. 125-126). After waiting about an hour and 15 minutes to ensure the dissipation of any gas in the pipe or separator, Tool Pusher Reeves and Motor Man Walker removed the cover and cleaned out the inside of the gas separator with a hose (Tr. 127-128). This was the first time that the port cover had been removed since the gas separator had been installed (Tr. 131-132). According to Tool Pusher Reeves he smelled gas "faintly" when the port cover was removed (Tr. 142). Prior to going onto the gas separator platform, Tool Pusher Reeves told Mr. Walker; "Whatever you do, don't light any cigarettes because that can be dangerous if when we get the cover off there is a presence of gas" (Tr. 128).

After the cleaning, the port cover was replaced, and two bolts inserted. The time then was "right about" 8:30 in the morning. Tool Pusher Reeves then asked Mr. Walker if he could put the rest of the

bolts in and tighten them in sequence. Mr. Walker responded, "yes." Before leaving, Tool Pusher Reeves told Mr. Walker, "Don't light any cigarettes" (Tr. 129).

Shortly thereafter, Mr. Walker left the platform and went up onto the rig substructure to make a "connection" (Tr. 130). The explosion occurred at 9:10 a.m. and propelled Mr. Walker 35 feet (Tr. 145). After the explosion, Core Tool Pusher Jacobs found a package of cigarettes, one-half of a broken cigarette, and Mr. Walker's damaged cigarette lighter, 6 feet out and away from the gas separator frame (Tr. 145-146). Tool Pusher Reeves testified that he had seen Mr. Walker's lighter in an undamaged condition on March 17th prior to the explosion (Tr. 189-190).

According to Tool Pusher Reeves he had instructed Mr. Walker prior to March 17th that he could not smoke on the rig floor, the mud pits, around the shale shaker, and the diesel and propane tanks. Places where employees could smoke were not designated or marked. Mr. Reeves testified that all of the "No Smoking" areas had not been posted on March 17th, and that Core intended to put a sign up at the gas separator (Tr. 134-135).

## Discussion

Core's brief concedes the violations of §1910.23(c)(1) and §1910.27 (b)(1)(ii) but argues that the Secretary failed to prove the violations were "serious."

Core's argument with respect to the unguarded platform violation (§1910.23(c)(1)) is unpersuasive. Certainly, the compliance officer's uncontradicted testimony that an employee would probably suffer serious physical harm if he fell onto the steel pipes that ran beneath the 10-foot high platform is patently reasonable. Moreover, his testimony to the effect that the pipes extended beyond the ends of the platform is supported by Exhibit C-1, a photograph which clearly confirms the location of these pipes.

Although a serious violation of §1910.23(c)(1) will be affirmed, assessment of a substantial penalty would be inappropriate. According to the OSHA compliance officer and the evidence Core has an excellent safety program. Furthermore, there is nothing in the record reflecting adversely on Core's good faith. But more importantly, the gravity of this violation is considered relatively low due to the infrequency of employee exposure to the unguarded platform from January 1982 to March 11, 1982. A penalty of $100.00 is considered sufficient to deter Core from a similar violation in the future, and will be assessed.

The record evidence, however, requires a different result with respect to the violation of §1910.27(b)(1)(ii). This judge agrees with Core that the Secretary failed to prove by a preponderance of the evidence that the lack of uniformity between the ladder rungs constituted a serious violation. Actually, the record establishes that the violation is de minimis.

As Core points out, the ladder rung distances were not uniform for a distance of only four feet. This deviation from uniformity also occurred beneath the 10-foot level. Moreover, the variance was slight - only two inches.

This case seems indistinguishable from cases in which the Commission has concluded that rung spacing was sufficiently uniform to provide a reasonably safe and suitable means of access. See, Rodney E. Fossett, d/b/a Southern Lightweight Concrete Co., 79 OSAHRC 92/D2, 7BNA OSHC 1918, 1979 CCH OSHD ¶23,989 (No. 76-3944, 1979); Ray Boyd Plaster and Tile, Inc., 78 OSAHRC 47/D8, 6 BNA OSHC 1648, 1978 CCH OSHD ¶22,794 (No. 76-814, 1978); Rust Engineering Company, 77 OSAHRC 37/C8, 5 BNA OSHC 1183, 1977-1978 CCH OSHD ¶21,693 (No. 12200, 1977). On this record, therefore, the violation of §1910.27(b)(1)(ii) will be affirmed as de minimis with no penalty. Core, however, is urged to take steps to ensure the proper installation of its platform ladder system.

Citing Mountain States Tel. & Tel. vs. OSHRC, 623 F.2d 155 (10th Cir. 1980), Core contends in its brief that the burden of proving all the elements of a violation rests with the Secretary. An element of every violation, of course, is the applicability of a cited standard to the working conditions at issue in a particular case. And the Commission has expressly held that the Secretary has the burden of proving the applicability of a cited standard. See Howard Barthelmass Painting Company, Inc., 81 OSAHRC 84/E1, 9 BNA OSHC 2160, 1981 CCH OSHD ¶25,637 (No. 78-5450, 1981).

In this judge's view, the standards at §1910.106(b)(6) and §1910.106 (f)(6) were inapplicable to the working conditions at Rig No. 11 on March 17, 1982 and March 18, 1982.

Standard §1910.106(b)(6) relates solely to working conditions concerning "Tank storage" (See, §1910.106(b)). Plainly, the gas separator and its related piping does not involve "tank storage." A gas separator simply separates the gas from drilling mud and then exhausts it away from the rig site.

Standard §1910.106(f), on the other hand, relates solely to working conditions in "Bulk plants." Certainly, by no stretch of the imagination, can Rig No. 11's oil and gas drilling site be defined as a Bulk plant (See, §1910.106(a)(7)). Core, therefore, was not on notice of, or required to comply with, the provisions of these two cited standards.

Perhaps the Secretary has promulgated standards applicable to the working conditions under items 3 and 4 of Citation No. 1. But if he has, he neither cited them nor mentioned them at the hearing. Items 3 and 4 of Citation No. 1, therefore, must be vacated.

Core, however, should take little comfort in the vacation of these items, particularly item 4, because the record clearly establishes the need to post a "No Smoking" sign at the gas separator for the protection of Core's employees and Core's recognition of this need. Further, common sense dictates that Core should not only point out to its employees the location of all "No Smoking" areas but also clearly designate those areas in which smoking is permissible.

## Findings of Fact

All findings of facts relevant and necessary to a determination of the contested issues have been found specially and appear above (See, Rule 52(a) of the Federal Rules of Civil Procedure). Any of respondent's proposed findings of fact inconsistent with this decision are denied.

## Conclusions of Law

1. The record establishes by a preponderance of the evidence that respondent committed a serious violation of 29 C.F.R. §1910.23(c)(1) with respect to its unguarded gas separator platform.

2. A penalty of $100.00 for respondent's violation of 29 C.F.R. §1910.23(c)(1) is appropriate.

3. The record establishes by a preponderance of the evidence that respondent committed a de minimis violation of 29 C.F.R. §1910.27(b)(i)(ii) with respect to the rung spacing of its gas separator platform ladders.

4. Standards 29 C.F.R. §1910.106(b)(6) and 29 C.F.R. §1910.106(f)(6) were inapplicable to the working conditions at respondent's Rig No. 11 on March 17 and 18, 1982.

5. On March 17 and 18, 1982, respondent was not required to comply with the provisions of 29 C.F.R. §1910.106(b)(6) and 29 C.F.R. §1910.106(f)(6) with respect to the working conditions in question.

## ORDER

Based on the Findings of Fact, Conclusions of Law and the entire record, it is ORDERED:

1. Citation No. 2, issued April 28, 1982, is VACATED.

2. Item 1 of Citation No. 1, issued April 28, 1982, is AFFIRMED, and a penalty of $100.00 ASSESSED.

3. Item 2 of Citation No. 1, issued April 28, 1982, is AFFIRMED as de minimis.

4. Items 3 and 4 of Citation No. 1, issued April 28, 1982, are VACATED.

## ORDER APPROVING SETTLEMENT AND DISMISSING CASE

On August 31, 1982, this matter was remanded by the Commission for further proceedings consistent with the Commission's opinion in Mobil Oil Corporation, Docket No. 77-4386 (August 6, 1982). The union representative had objected to a settlement agreement executed by the employer and Secretary on September 17, 1979. The matter was certified to the Commission on interlocutory appeal by Judge Patton in order to ascertain what rights the union representative had to be heard on its objection to the settlement agreement. Subsequent to the remand, this matter was scheduled for hearing on October 19, 1982. Counsel for respondent, by letter dated September 28, 1982, to Judge Burroughs stated "that the operations which were cited have long since been discontinued and the case is therefore moot so far as alleged hazards are concerned." On October 7, 1982, a letter was directed by Judge Burroughs to the union representatives seeking their comments on the representation that the cited operations have been discontinued.

On October 15, 1982, a letter was received from Mr. Jim Gattis, President, Allied Industrial Workers of America, Local 370, stating that the union had "determined that the operation where Whirlpool was cited for over exposure (sic) is no longer in existence." Mr. Gattis concurs with counsel for Whirlpool that the question concerning a settlement is moot since the cited operation is no longer in existence. Mr. Gattis further stated that the authorized employee representative saw no need for further proceedings in this matter. Accordingly, it is

ORDERED: 1. That the terms of settlement are approved and incorporated as part of this order;

2. That the serious citation issued to respondent on November 7, 1978, is modified to affirm the violations as being other than serious and to vacate the penalty proposed for the violations;

3. That respondent's motion to withdraw its notice of contest, pursuant to the terms of the settlement agreement, is granted; and

4. That the abatement measures set forth in the settlement agreement are unnecessary if the operation covered by the citation has been discontinued.

Dated this 15th day of October, 1982.

## NOTICE OF DECISION

Secretary of Labor v. D. A. & L. CARUSO, INC.
OSHRC Docket No. 80-7259

1. Enclosed is a copy of my decision. It will be filed with the Commission on October 18, 1982, and will become the final order of the Commission on November 17, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is November 17, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

141 South Harrison Street
East Orange, New Jersey 07018
Attn: David J. Weston, Esq.

Brennan, W. E., A.L.J.

STATEMENT OF THE CASE

This case arises under the provisions of Section 10(c)[1/] of the Occupational Safety and Health Act of 1970 (hereinafter the Act).[2/] There is at issue a one-Itemed "Willful" Citation issued pursuant to Section 9(a) of the Act[3/] by the Secretary of Labor through the Area Director of the Occupational Safety and Health Administration (OSHA) for Hasbrouck Heights, New Jersey, (hereinafter Complainant) to D. A. L. Caruso, Incorporated, of South Plainfield, New Jersey, (hereinafter Respondent). A penalty of $8,000 was proposed by Complainant pursuant to Section 10(a) of the Act.[4/]

By Order dated February 11, 1981, this case was assigned to Judge O'Connell for determination (R.p. 9)[5/], who, after

Exh. R-1 Respondent's Exhibit in evidence.

the perfection of pleadings and completion of pretrial discovery and pursuant to written notice (R.p. J-7) held a hearing in this case on May 11, 1981.

Thereafter, as a result of a major reduction in Review Commission personnel, Judge O'Connell left the Commission and on February 11, 1982, this case was reassigned to the undersigned.

After affording the parties an opportunity for a de novo hearing or to supplement the record herein with additional evidence, which was declined, the parties agreed to have this case decided on the record as it had been formulated. (See R. pp. J-13, J-14 and J-15).

The "Willful" Citation, issued to Respondent on November 20, 1980, alleges as follows:

> 29 CFR 1926.651(c): The walls or faces of excavation(s) in which employee(s) were exposed to danger from moving ground were not guarded by a shoring system, sloping of the ground, or some other equivalent means:
>
> > Manhole #71, Station 21-08-31, East and West Walls:
> > Excavation in which employee(s) were required to work was approximately 40 L X 25' W X 13' D.

This condition was to be corrected "immediately" and a $8,000 penalty was proposed.

The cited OSHA Standard provides:

> 1926.651 Specific excavation requirements.
>
> * * *
>
> (c) The walls and faces of all excavations in which employees are exposed to danger from moving ground shall be guarded by a shoring system, sloping of the ground, or some other equivalent means.

## ISSUES

1. Did the faces and walls of the excavation at issue expose Respondent's employees to the danger of moving ground, and thus, did Respondent violate Section 5(a)(2) of the Act, 29 U.S.C. 654(a)(2) by failing to comply with the OSHA Standard set forth at 29 C.F.R. 1926.651(c)?

2. If a violation is found, is it accurately denominated "Willful"?

3. If a violation is found, what, if any, penalty is appropriate under Section 17 of the Act, 29 U.S.C. 666?

Issues numbered 1 and 2 supra are answered in the affirmative and a penalty appropriate under 29 U.S.C. 666 is assessed infra.

## EVIDENCE AND OPINION

The following stipulations were agreed upon by the parties.

Respondent's full and legal name is D. A. & L. Caruso, Inc., a Corporation in the State of New Jersey with its principal place of business located at 3950 South Clinton Avenue, South Plainfield, New Jersey. Respondent concedes that at the relevant times herein, it was engaged in a business affecting commerce, having an average daily number of 45 employees, not including family employees. Respondent is a small to medium size corporation engaged in sanitary sewer installations for municipalties and other similar government bodies (Tr. 4, 5).

Complainant's Second Request for Admission of Facts, served upon Respondent on April 2, 1981, were not responded to, and thus, the facts set forth therein are deemed admitted under Federal Rule of Civil Procedure 36, made applicable to these proceedings by Commission Rule of Procedure, 2(b), 29 C.F.R. 2200.2(b). These facts essentially establish that this Respondent, on February 26, 1976, was issued a one Itemed Serious Citation for violation of the "Specific Trenching Requirements" Standard set forth at 29 C.F.R. 1926.652(a). Although initially contested by Respondent, a Stipulated Settlement of this Citation was reached between the parties, which settlement became a final order of the Review Commission prior to November 3, 1980. (See Exh. C-1 with attachments).

ISSUE NO. 1

The Complainant's evidence was presented through one witness, OSHA Compliance Officer (C.O.) Marinan. At the time of trial, Mr. Marinan had been a C.O. with OSHA for ten years and had conducted approximately 1,700 OSHA inspections, of which approximately 1,000 involved construction worksites. Prior to his OSHA experience, he had spent about four and one-half years in the maritime industry with the John W. McGrath Corporation of New York City involved in daily inspections of

ocean going vessels to determine compliance with the Longshoremens and Harbor Workers Act, making accident investigations and related work. Prior to that period, he was a U. S. Army Special Forces Medic schooled in emergency medicine. Thus, C. O. Marinan had over 15 years of experience in the safety field. His safety education included various safety and health courses while with OSHA, including soil identification, mining and tunneling, flammable materials and liquids, a one week course specifically dealing with soil mechanics and identification as well as the OSHA Standards governing trenching and excavation requirements, and various other seminars (Tr. 9, 36, 37).

The inspection from which this case arose was conducted by C. O. Marinan on November 3, 1980. At this time, Respondent was engaged, and had been since August 1980, in installing an interceptor sewer line system for the Northwest Bergen County Sewer Authority in Bergen County, New Jersey. This project called for Respondent to install approximately 29,000 feet of interceptor sewer lines, consisting of various sizes of reinforced concrete pipe, ranging from 15 to 36 inches in diameter, in trenches excavated by the Respondent to various depths up to 20 feet, in varying types of soil.

On the day of the inspection, work had progressed to a location in Mahwah, New Jersey between Halifax and Valley Brook Road which was an undeveloped area, just North of the Ramapo River.

At this location (herein the worksite), Respondent had excavated for and was in the process of installing a large, circular, precast concrete manhole identified as number 71, as part of this project. In a Northerly direction from the Ramapo River, Respondent had excavated a trench and installed sewer pipe up to the point where Manhole 71 was to be installed. At that point, the excavation for the manhole was made, which was irregularly, circular or oblong in shape.

This excavation measured approximately 35 feet across its widest point in an East-West direction, was approximately 40 feet long in a North-South direction, and varied from approximately eight feet four inches deep at the North wall to from 13 to 15 feet deep at the point where the manhole was to be installed. The South side of the excavation did not have a clearly defined boundry because it was the site of the trench excavation in which the sewer pipe leading to the manhole had been installed. This trench to some degree had been backfilled. Thus, this site, including the backfilled sewer trench and the open excavation, if viewed from above, presented a roughly defined keyhole type of shape.[6/] (Tr. 11, 20, 21, 62, 63, 64, Exhs. C-12 and R-1).

---

6/ The C. O. measured the North wall of this excavation and found it to be approximately 25 feet wide (Tr. 20). Respondent's Chief Field Engineer, Mr. Pickin, measured the width of the excavation at its widest point, across the top of the manhole and found it to be 35 feet wide (Tr. 64, 65). Thus, because of the irregular shape of this excavation, these measurements do not present conflicting testimonial evidence.

On November 3, 1980, C. O. Marinan, at approximately 1:25 P.M., approached the excavation site walking from the Ramapo River in a Northly direction. He stopped momentarily and took a photograph of the scene he viewed, Exhibit C-2. This exhibit shows, in the foreground, the backfilled trench, the open excavation with one section of the precast Manhole 71 in place within the excavation, an employee of Respondent, later identified as Salvatore Trippicchio, standing between the manhole and the East wall of the excavation and part of the large, 100 ton backhoe used to dig the excavation and install the manhole, positioned on the surface of this ground above the North wall of the excavation. As he proceeded towards the excavation, he observed vertical walls of the excavation, some of which were undermined or undercut as well as a considerable amount of water at the bottom of the excavation. The C. O., after identifying himself to Respondent's foreman, Mr. Louro, and a brief opening conference, advised the foreman of the conditions he observed concerning the excavation, which in his view constituted a violation of the OSHA Excavation Standard and represented a danger of cave-in to the employee within, who should be removed until the walls of the excavation were brought into compliance with the OSHA Standard, thus making this excavation safe for employees to work within. Mr. Louro complied with the C. O.'s advise and ordered Mr. Trippicchio out of the excavation (Tr. 11, 12, 16, 17, Exhs. C-2, C-3).

The C. O. then proceeded to further inspect and photograph this excavation. Exhibit C-4 is a photograph of the West wall of the excavation looking towards the South. It depicts the vertical and undercut West wall, with the top layer of virgin, previously undisturbed soil, with a part of a fallen, buried tree projecting from its face. Exhibit C-5 is another view of the West wall, showing its vertical and undercut side. At this point, the excavation wall is approximately 13 feet high. Exhibit C-6 shows the C. O.'s tape measure, which he has put into the excavation to demonstrate the vertical nature of the North wall. (The C. O. took this photograph standing at or near the edge of the North wall, facing to the West, at a place marked by a circled X in the photo. His tape measure, running from left to right lies on top of the edge of the North wall, and then drops out of sight down the face of this wall (Tr. 17-20). At this point, the excavation was eight feet four inches deep.

Exhibit C-7 shows the East wall of the excavation with Respondent's President, Mr. Dominick Caruso, who was called to the site after the C. O.'s arrival, standing on the surface (without a hard hat), three employees and a section of the precast manhole elevated above the ground being prepared to be placed in the excavation.

Manhole 71, upon its completion, consisted of two, precast, reinforced concrete sections, each measuring seven feet high with a six and one half foot diameter, one placed atop the other, with a precast concrete cover as its top. (See Exhs. C-10, C-11).

At approximately 1:50 P.M., on November 3, 1980, Respondent's President, Mr. Dominick Caruso arrived at the scene and he contacted the C. O., asking the C. O., ". . . what the problem was." The C. O. informed him of the vertical walls of the excavation, the water present within the excavation, and the undercut or undermined walls all of which presented a risk that there might be a cave-in and thus, a danger to his employees within the excavation. Mr. Caruso replied that the excavation ". . . was wide enough." The C. O. and Mr. Caruso then proceeded to the North wall of the excavation where the C. O. demonstrated the vertical shape of that wall by using his tape measure (Exh. C-6). The C. O. further took a handful of the excavated earth and identified it as "clay", advising, in effect, that because the wall was not "solid rock and shale", (which may be vertical under the OSHA Standards), it should have been sloped back and not vertical. Mr. Caruso then, ". . . yelled something in Spanish or Portuguese to the employees and the operations commenced." The C. O. then asked Mr. Caruso if he intended to comply with the OSHA Standard,

and Mr. Caruso replied, ". . . first I finish the manhole, then I comply." The C. O. then advised that Respondent would be cited for a willful violation. Mr. Caruso "just shrugged", work recommenced and the construction of the manhole went forward to its completion. This work exposed three of Respondent's employees within the excavation to the danger of moving ground, Foreman Louro, and employees Trippiccio and Branco. After completing the errection of the manhole, the sides of the excavation were further excavated back or sloped (Tr. 26, 27).

During trial, the foregoing testimony of the C. O. was not rebutted in any way, particularly the statements and actions of Respondent's President Caruso, as Mr. Caruso was not called as a witness. Thus, this testimony is afforded full credence.

Exhibit C-8 is a photograph of the East wall of the excavation after work had been resumed upon Mr. Caruso's orders. An employee is standing in the excavation giving signals for the placement of the upper section of the manhole. Immediately to the left of this employee, is shown some type of form work supporting concrete which had been placed over the large sewer pipe previously installed which ran into the manhole. This view is looking Southward.

Exhibit C-9 depicts the same excavation looking Northward, showing the upper section of the manhole in place and two employees within the excavation. There is also visible the

tracks of the 100 ton crane used to hoist the manhole sections, pipe and to accomplish the digging, positioned on the surface level near the North wall of the excavation.

Exhibit C-11 is another view taken of the excavation looking Northward, showing the three identified employees within the excavation.

The C. O. further testified that during his inspection, he saw "blocks of soil falling into the excavation", from its Northeast and West walls, which, if an employee was at that point, could have suffocated him or "broken every bone in the employee's body", because of the large size of blocks of soil (Tr. 22, 41, 44).

This episode occurred when the 100 ton backhoe was craning a steel plate into the excavation which was then pounded by the large shovel into the excavation bottom, which was to function as a form for concrete poured over the preexisting sewer pipe. (Exh. R-2 shows such plates in place).

Additionally, the C. O. testified that during his inspection on November 3, 1980, he asked both the Respondent's President, Dominick Caruso, and Superintendent, Anthony Caruso, if they were aware of the OSHA requirements regarding the protection of excavation and trench walls from collapse by shoring or sloping back to the angle of repose, and they both indicated that they were. The C. O. then asked why they had not complied with these requirements. Respondent's president indicated that a log or

fallen tree covered by and partially protruding from the top layer of soil, could have been 60 to 70 feet long, and to slope back would have disturbed this buried log which ". . . would have been too tough to handle." This rational proved erroneous however, because when this wall was further excavated and sloped back, the protruding log proved to be about 24 inches in diameter and approximately eight (feet) long.

In reply to the C. O.'s question, Respondent's superintendent stated that he had sloped the excavation walls when initially dug, but due to ground water the base of the slopes had washed away leaving partially vertical walls. Further, he stated that the C. O. had come at the "wrong time", as they were making a turn (in the sewer pipe line, the manhole being located at this turning point). (Tr. 26).

Again, this testimony of the C. O. regarding statements made by Respondent's president and superintendent are neither rebutted nor challenged in this record, as neither individuals were called as witnesses. Thus, this testimony is given full credence.

Additionally, C. O. Marinan testified that during his inspection he was joined by Respondent's Chief Field Engineer Pickin. They discussed the excavation and its vertical walls and the C. O. stomped the top of one wall with his foot and a block of soil fell into the excavation. Mr. Pickin reportedly

agreed with the C. O. that some of the excavation walls were vertical and should have been sloped or protected (Tr. 46).

During his inspection, the C. O. observed a significant amount of water in the excavation which was being controlled by a sump pump pumping the water out of the excavation through a length of hose. (See Exh. C-10 which shows the pump and hose suspended from a cable).

The C. O. testified that the water was welling into the excavation apparently from near the North wall. Respondent, through its expert witness claims that the water was coming from the nearby Ramapo River, filtering through the crushed stone bed upon which the previously installed pipe had been placed.

Regardless of its source, there is no doubt that water was entering this excavation, as shown in Exhibits C-3 and R-4. Respondent does not challenge the C. O.'s position that this water presented an additional adverse factor to the stability of the excavation walls, in that it could further undermine the base of these walls, thus making them more subject to collapse. In fact, Respondent's superintendent reported to the C. O. that this was precisely what had happened in that the walls were initially sloped back, but that water had washed away the lower portions thereof, creating the vertical walls.

After the installation of Manhole 71 had been completed, Respondent did further excavate and slope the excavation walls. This operation took approximately 25 minutes. Exhibit C-10 shows the reexcavated East wall, completed manhole and the sump pump and hose. Exhibits R-2 thru R-5 similarly are various views of this excavation taken by Respondent's Superintendent Caruso after the reexcavation and sloping of the walls. The C. O.'s opinion that the portions of the excavation's walls which were vertical, basically the North and West walls, and part of the East wall, (he readily admitted that some parts of the walls were sloped back to some degree), were unstable was proven during this reexcavation and additional sloping process. He testified that when the large shovel (See Exh. R-5) struck the East wall (to further slope it back), ". . . the entire North wall came down with a clop, en masse." (Tr. 48). This testimony is unchallenged and unrebutted in this record and thus is entltled to full credit.

In summary, C. O. Marinan testified in effect, that based upon his observations of the excavation in question, to wit: some parts of the walls were vertical and undercut and undermined; the walls consisted of various strata, the bottom part of which was evidently a soft material as it had been washed away or undermined by the water present in the excavation; the presence of the water which increased the instability of the walls; cracks in some of the walls; seeing large chunks fall

from the face of the walls during the installation of the steel plate, concrete form; stomping on the top of a wall and thereby dislodging some soil from its face, and seeing the entire face of the North wall collapse during reexcavation procedure; he determined that the East and West walls of this excavation were not guarded by a shoring system, adequate sloping or equivalent means and thus recommended the issuance of the Willful Citation herein because not less than three of Respondent's employees were exposed to the danger of moving ground (Tr. 8-58, 122, 123).

A thorough study of the C. O.'s testimony leads to the conclusion that it is fully creditable.

Respondent defends this action by basically arguing that the excavation in question was dug in soil classified as "Cemented Sand and Gravel", and thus under Table P-1 showing "approximate Angle of Repose for Sloping of Sides of Excavations", appearing immediately after 29 C.F.R. 1926.652, the parts of the excavation walls which were vertical were not in violation of the cited OSHA Standard 29 C.F.R. 651(c).

This defense was put into the record through three witnesses.

Respondent's first witness was Mr. Pickin, its Chief Field Engineer since late in 1978. He testified that his responsibilities included overseeing Respondent's field engineers for all projects concerning the technical aspects

of the jobs, i.e., quantities [of materials] and conformance to shop drawings and the like. He stated that the Northwest Bergen County Sewer project called for the installation of approximately 29,000 feet of interceptor sewer pipe of various sizes ranging from 15 to 36 inches to be installed in "cuts", i.e., trenches and excavations varying up to 20 feet in depth in varying soil conditions. Respondent had begun this project in August of 1980, three months prior to the OSHA inspection, at which time Manhole 71 was installed as a pivot point in the turning of the sewer line, which was quite close to the Ramapo River. He voiced the opinion that "The majority of the water . . ." observed in the excavation on the day of the inspection was water from the Ramapo River which came into the excavation through the stone bedding upon which sections of the previously installed sewer pipe had been placed. This water was being pumped out of the excavation by a sump pump placed at a low section of the excavation. This testimony does not critically contridict that of C. O. Marinan, who testified that he was told by some representative of Respondent that the source of the water observed in the excavations was the river's water table and that he observed some water entering the excavation from the base of one of the excavation's walls, because, the exact source of the water observed in the excavation is not that critically important. Respondent does not contest the fact that a large enough amount of water to require

pumping out was getting into this excavation. The presence of this water in this excavation certainly did not add to the stability of its walls, rather, if anything it made these walls less stable, which was confirmed by Respondent's Superintendent, Anthony Caruso, who told the C. O. that the walls of the excavation had initially been sloped but that the water had washed away their bases, at some points, making the walls vertical. The adverse effect of water within an excavation is recognized and referred to in the OSHA Excavation Standards, such as in Table P-1, following 29 C.F.R. 1926.652, which has the following note: "The Presence of Ground Water Requires Special Treatment." See also the Specific excavation requirements relative to water in excavations set forth at 29 C.F.R. 1926.651(h), (j) and (p).

Mr. Pickin further testified to talking with C. O. Marinan on the day of the inspection at the site of the excavation, during which, "Mr. Marinan felt that the excavation was insufficiently protected. . . . due to the nature of the walls of the excavation." Mr. Pickin's response was, "I felt that although the slope was vertical in nature, for a certain section of it, that due to the width of the excavation, it was not unsafe." (Tr. 64). He testified to having measured the width of this excavation across the top of the manhole with a "grade pole" and found, "At the maximum width it was 35 foot." (Tr. 64).

He further testified on cross-examination that the manhole was "about 8 1/2 feet wide." (Tr. 70).

Thus, this excavation was in effect bisected by both the manhole structure being errected and the previously installed sewer pipe. Subtracting the 8 1/2 feet occupied by the manhole from the 35 foot maximum width, leaves a total, unoccupied width of 26 feet, 6 inches, which when divided by two, leaves a maximum distance on either side of the manhole of 13 feet, three inches, at the level at the top of the manhole. Thus, the space between the manhole structure and the walls of the excavation could not have been over approximately 13 feet at the top of the excavation and as clearly evident in the photographic exhibits, was considerably less at the bottom of this excavation. Consequently, the work area at the bottom of the excavation to the sides of the manhole were quite narrow. See Exhibits C-9 and C-11. In addition to the manhole structure within this excavation, there were also large steel plates used as concrete forms which contained concrete placed over previously laid sewer pipe. See Exhibits C-8, C-9, C-10, C-11, all of which presented formidable obstacales which would have prevented or at best seriously impeded an employees escape from a collapsing wall. Thus, Mr. Pickins opinion that the excavation was safe because of its width is worthy of little or no weight.

Mr. Pickin confirmed the C. O.'s testimony that part of one wall of this excavation did collapse when a steel plate, to be used as a concrete form, was installed next to the manhole. See Exhibit R-3, a photograph taken by Superintendent Anthony Caruso of the steel plate leaning against the West side of the manhole.[7/]

Mr. Pickin further testified that Respondent, in digging the excavation in question, used a large backhoe, which weighed approximately 100 tons. That this piece of equipment was also used to lower sections of the manhole and steel plates into the excavation and as so utilized, was positioned fairly close to the edge of the excavation, its tracks coming to within ten feet of the edge of the excavation. Additionally, that the shovel of the backhoe was used to force the steel plates into postion at the bottom of the excavation, and its operation caused "a lot of vibration." (Tr. 67, 68). See Exhibits C-2, C-7, C-8, C-9, and R-5 which depict this large backhoe and the operations described supra.

Of course the use of this 100 ton backhoe near the edge of this excavation, which caused considerable vibrations, did not add to the stability of the walls thereof. Rather, it had an adverse effect thereon by placing significant weight

---

7/ Photographic Exhibits R-2 thru R-5 were taken by Superintendent Caruso on the day of the OSHA inspection at approximately 2:50 to 3:00 P.M. These photographs were taken immediately after Respondent had increased the angle of the slope of the excavation sides. (Tr. 65, 66, 122).

just behind the excavation walls and also by transmitting significant vibrations into the ground below.

Lastly, Mr. Pickin further confirmed C. O. Marinan's testimony concerning earth being displaced from one wall of the excavation when the C. O. stomped on the surface above its face (Tr. 68-69).

Respondent's second witness was its General Manager, Mr. Crandall who had occupied that position for about two and one half of his five year employment by Respondent. He was a 1969 graduate from Union College with a degree in Civil Engineering. As General Manager, he supervised all of Respondent's operations including bidding on contracts for utility projects.

He explained the preparatory work carried on to submit a bid on a project; the study of drawings and anticipated soil conditions through which the project will pass which generally involves a study of soil test borings.

In the project at issue, Mr. Crandell testified that based on the preliminary studies, ". . . we determined from it that the majority of the project could be open cut. By that I mean excavating and sloping the sides. We found that where there was'nt any water condition problem, we found we would be able to excavate without a dewatering system. Where there was a dewatering system required we would install well joints, or deep well, and proceed from that point. The whole

purpose of this is to determine the most economical way to do the jobs so that you can subsequently become the low bidder.[8/]

In many cases we had a variant salt [sic soil] condition and in some cases we could open cut as I mentioned, and in many areas of the job we have installed well point systems, deep well systems. In other areas of the job we've installed tight wood sheeting and tight steel sheeting. So it all depends on your experience and the nature of the soil that you're involved with." (Tr. 79, 80).

In relation to the excavation at issue, Mr. Crandall stated that it was determined to make an "open cut" for that as well as most of the upper end of the project. "As the determining factor in this case, was the fact that we had a wide open field or wooded area that was clear. So we did'nt have houses and other structures that we would be worried about damaging. We could slope the trench fairly wide. So our determination prior to bid was that we would do this." (Tr. 80).

Thus, in preparing its bid for this project, it was determined to use an "open cut" type of excavation where soil conditions permitted. In the words of its general manager, "open" cutting meant sloping the sides. However, as the testimony of the inspecting C. O. and the photographic exhibits definitely establish, this plan was not carried out

---

8/ On cross-examination, Mr. Crandall further defined "open cut" to mean ". . . sloping the trench at whatever angle is deemed stable." This angle of repose varies, according to Mr. Crandall, "Depending" upon the conditions in the field." (Tr. 84).

for the excavation at issue as some of the walls of this excavation were vertical and undercut or undermined.

Mr. Crandall further testified to Respondent's safety program, evidently a written program compiled by Respondent's insurance company, his office, ". . . and other safety consultants." (Tr. 80). Upon being hired, employees receive a copy of this program. On Friday evenings there is a meeting ". . . with all the supervisors at the main office. And its mainly for scheduling and construction procedures but one of the topics is always safety." (Tr. 80, 81). He further stated that Respondent utilizes "trench shields" when needed which are designed by professional engineers as well as shoring systems, similarly designed. Additionally, he identified Dr. Robert Kondner of Kondner Engineering Technical Services as Respondent's "general soils consultant." (Tr. 81).

He testified that his visits to Respondent's project's varied, averaging two to three times a month. He was not at the excavation site at issue in this case on the day of the OSHA inspection nor for three days thereafter. However, sometime after the Citation herein was received, he called Dr. Kondner and requested that he do some soil sampling and some soil borings at the site of the excavation, as Respondent . . . "did'nt basically agree with the Compliance Officer. We felt that the only way to make sure that our professional analysis and gut feeling, so to speak, was correct, was to

have a professional look at the soils and to do the proper laboratory tests and either confirm that we were right or we were wrong." (Tr. 83, 75-90).

Respondent's final witness was Dr. Robert L. Kondner, who holds B.S., M.S. and Ph.D. Degrees in Civil Engineering from John Hopkins University. He has been a "professor of engineering" at the Technological Institute at Northwestern University in Evanston, Illinois, at the University of Maryland at College Park, Maryland and at Loyola College in Baltimore, Maryland, teaching both graduate and undergraduate courses in soil mechanics and foundation engineering; soil rheology (the study of stress-strain and time of materials); ground water flow; soil dynamics; mechanics; hydraulics; structured mechanics and similar courses. He has directed research programs for the National Science Foundation, U. S. Army Corps of Engineers under the Nuclear Weapons Effects Board, the National Academy of Science and National Property and Highway Research Program.

Dr. Kondner testified that at Respondent's request he visited the excavation site at issue here, on January 6, 1981, to supervise the taking of a test bore sample of the ground near the excavation (the excavation having been backfilled by this date, assumedly), by "the firm of Walsh", (Tr. 93), who had taken the pre-bidding test bore samples for Respondent. At the time of his January visit to this

site he was aware that the Citation at issue had been received by Respondent.

He testified that the test boring was taken some 18 feet to the West of Manhole 71. His analysis of this sample revealed a top soil layer of loam to a depth of two feet. Under that layer was a 12 foot deep strata of "cemented sand and gravel." (Tr. 94). Below that strata there was "cohesive sand/silt mixture" for the next six feet, as the test hole was 20 feet deep in all. After submitting this sample to the "Direct Shear Tests" (and moisture content), Dr. Kondner testified that in his opinion that, ". . . if you were to cut that slope, [in the soil of the type he found in his sample] that material very carefully, in a vertical slope, it would hold up to a depth a little over 22 feet. Now from a practical situation, with a big backhoe, and a big bucket of a backhoe going in and excavating, its not like cutting it with a teaspoon. You shake the ground, you dig the material. I would not design anything to come anywhere near that depth. However, for a depth of 13 feet, you have a factor of safety with a vertical slope, of 1.72. Now normal construction, normal good engineering practice construction, for excavations, usually uses a value for factor of safety of slope, somewhere between 1.2 to maybe 1.5." (Tr. 97-98). It was his opinion further, that based upon his boring sample and

tests thereon, that the vertical cuts [of the excavation in question] "absolutely" posed no hazard or danger to the men working in this excavation. He further testified that his test bore sample revealed "cemented sands and gravels", and thus according to Table P-1 of the OSHA Standards, vertical walls (a 90° angle of Repose) was proper (Tr. 99).

After his study of the various photographic exhibits and listening to prior testimony, (Dr. Kondner never did view the actual excavation in question), he was of the opinion that the water in the excavation migrated from the nearby Ramapo River through the crushed stone which had been placed beneath the previously installed sewer pipe and base of Manhole 71.

On the witness stand, he testified using the original, color photographic exhibits, which he had only seen zeroxed copies of previously. He identified, from these photos, the "cemented sand and gravel" he said was depicted therein, and further explained, that in some photos, this was covered as ". . . much of the top soil has been spoiled down into the excavation, and in fact covers over this hard, dense, cemented sand and gravel." (Tr. 102)[9/]

In at least two photographs, he identified the "cemented sand and gravel", in the bottom of the excavation which had fallen into the excavation by being dug by the backhoe (Tr. 102-104, Exh. C-4, C-6).

---

9/ He mistakenly believed Respondent's photos, Exh. R-2 thru R-5, showed the excavation prior to the resloping of its sides (Tr. 102).

As to Exhibit C-7, Dr. Kondner's examination of this photo led him to conclude that it showed a, "slightly different deposition" of the soil strata, "at this particular area." (Tr. 104).

Finally, he testified that, "I see nothing in these photographs which indicates any form of instability or impending movement of the earth.", and "I don't think there was any danger to workmen in that excavation". (Tr. 107).

Upon cross-examination, it developed that Dr. Kondner, over the past five or six years had appeared as a witness for Respondent "Probably three times." Further, that only one test boring sample was taken "approximately 18 feet" from "approximately from the center." of Manhole 71 (Tr. 108). He was unable to detect any undercutting of the excavation wall shown in Exhibit C-5 or Exhibit C-11 (Tr. 109).10/

Finally, Dr. Kondner testified as follows on cross-examination:

> Q Assuming that at one point it was sloped, and at a later point, some of those photographs demonstrated fairly close to vertical. How did that happen if this is such a cemented sand? That it doesn't wear away or erode.
>
> A What I said was this. And I think this probably shows in these photographs. I said if you could very carefully cut this material,

---

10/ He reached this conclusion by drawing a blue line supposedly parallel to the vertical Manhole 71 in Exhibit C-11. However, a careful use of a ruler establishes that this blue line is not parallel to the vertical side of Manhole 71. (Tr. 109-111).

you could have a fairly clean slope, very deep. The order of 20 to 22 feet. But in a practicality, digging with a big backhoe like this, the backhoe goes down, it rips the material, it tears it out. It's not very carefully cutting it. And that's why in some cases here, depending upon the individual material, depending upon how the individual buckets go in and rip it out, some may be sloped more than others. As a matter of fact, the bucket going in could be cutting a vertical slope and as he comes up, he loses part of that material that he gouges out, and it obviously then has the cementing action broken. Because it is not as hard as concrete. It breaks the cementing action. And then you have the individual particles. The individual gravel particles and sand particles. And they're going to lay on in there in a slope. At the approximate angle of the friction angle. Because you now have this material --- this material as I tested it, had a cohesion and internal friction. Once you break it up, you break the cementing action which is the cohesion. And then the only thing you have left is the internal friction. And that should be approximately 50 degrees. 45 to 50 degrees. Because the angle of internal friction that I got from my tests was a little over 49 degrees. And that I think is what you're seeing in these photographs when you see these sloped surfaces. It's the broken up cemented sand and gravel which the machine dug out.

Q Did you just say that once you break up the sand and gravel, there's no more cohesion?

A That's right. You break the binder.

Q Well If there's no more cohesion, Dr. Kondner, how can you say that a totally vertical angle will do?

A Certainly. Because I said this. If you'll let me give you the story here. If you go in very carefully. If I go in with a bucket, say similar to something like trying to cut this wall, if I go in with that bucket, I'm tearing the material out here. But if I very carefully avoid tearing it in here, this material still

has its cemented action, whereas the material that the bucket grabs the bucket breaks up. Now if the bucket doesn't pick every bit that it breaks up, up, it's going to fall in a pile. Along side of this wall.

Q So assuming that someone didn't go in with a spoon, and very carefully erect a straight vertical, and there would be some displacement somewhere, do you still insist that the straight vertical would be entirely safe?

A Yes it would. It depends on the excavation. And the tear of the excavation.

Q Did you happen to see the excavation here?

A Not open. But I have seen other excavations along that area. I did not see this excavation open.

Q You don't know what kind of care was taken with this excavation, do you?

A No. I don't. (Tr. 116-118).

When the entire testimony of Dr. Kondner is carefully studied, his opinion that the walls of the excavation presented no danger of moving ground to employees does not outweigh the actual on site observations of C. O. Marinan, who stomped on the surface above one wall and dislodged earth from the face below; who witnessed the entire face of the North wall of this excavation collapse when the 100 ton backhoe was re-sloping another side of the excavation, and who saw additional earth collapse when this backhoe bucket was used to pound a steel plate into position as a concrete form at the bottom of the excavation.

The substantial and creditable evidence of this record considered as a whole, fully supports the conclusion that the walls of the excavation in question did expose Respondent's employees to the dangers of moving ground as portions of these walls were neither guarded by a shoring system, nor adequately sloped nor protected by any other equivalent means. The violation as alleged is established in this record.

ISSUE NO. 2

Is the violation accurately denominated "Willful"?

The majority rule of the Circuit Courts who have spoken to the question, as well as the Commission, holds that a "Willful" violation is one involving voluntary action, done either with an intentional disregard of, or plain indifference to, the requirements of the statute. No showing of malicious intent or bad motive is necessary. A conscious, intentional, deliberate, voluntary decision is properly described as "Willful". See National Steel and Shipbuilding Co. v. OSHRC, 607 F.2d 311 (9th Cir., 1979); and Secretary of Labor v. Kus-Tum Builders, Inc., OSHRC Docket No. 76-2644, 10 OSHC BNA 1128 (1981), and cases cited therein.

The evidence of this record clearly establish the necessary elements of a "Willful" violation.

As to Respondent's knowledge of the requirements of the OSHA Excavation Standards, C. O. Marinan testified that prior

to the November 3, 1980 inspection, he was directed to conduct a general schedule inspection of Respondent's worksite. On August 26, 1980, he went to the general worksite and talked with Respondent's Superintendent, Anthony Caruso. At this time Respondent was engaged in surveying and cutting trees, the actual trenching and excavation had not yet begun. The C. O. testified to having had ". . . an extensive conversation with Superintendent, Mr. Anthony Caruso, I gave him copies of the regulation, and specifically, the OSHA booklet, 20-26, which breaks out trenching and excavation requirements". (Tr. 25).

Additionally, in February, 1976, Respondent was cited for a serious violation of the trenching standard set forth at 29 C.F.R. 1926.652(a), a violation substantially similar to the one at issue here only in a trench rather than an excavation, i.e., failure to shore, sheet, brace or properly slope the sides of the trench. Although originally contested, that case was terminated by a settlement, that Citation becoming a final Order of the Commission. The trenching and excavation requirements appear in the same section of the OSHA Standards, Subpart P - 29 C.F.R. 1926.650 through 1926.652. See Exhibit C-1.

On the day of the inspection involved here, November 3, 1980, the C. O. testified that he asked both Anthony Caruso

and Respondent's President, Dominick Caruso, if they were aware of the requirements of Subpart P. They answered that they were aware of the requirements (Tr. 25,26).

Although Respondent's Foreman Louro ordered one of Respondent's employees out of the excavation upon the C. O.'s suggestion at the beginning of the inspection on November 3, 1980, when President Caruso arrived on the scene, the C. O. discussed the hazards with him but Mr. Caruso ". . . directed everybody back in the excavation, . . ." (Tr. 23). After showing Mr. Caruso the vertical walls, overhangs and water in the excavation, the C. O. asked him if he intended to comply with the OSHA Standards. Mr. Caruso replied, ". . . first I finish the manhole, then I comply." (Tr. 26, 27). Even after being advised by the C. O. that he could be cited for a willful violation, Mr. Caruso, ". . . just shrugged and continued on with the operation and then when they did put the additional section on the manhole, then as he said prior, then he complied." (Tr. 27).

This testimony of C. O. Marinan is not contested or rebutted in any way.

The violation herein is properly characterized as "Willful".

## PENALTY

The C. O. testified to his computation of the proposed penalty of $8,000 following the standard penalty computation procedures. For a willful violation, the penalty proposed

by the C. O. is evidently reviewed by his supervisor as well as the Area Director, and only then issued in conjuction with the "Willful" citation (Tr. 34).

After an independent evaluation of the statutory penalty factors set out in Section 17(j) of the Act, 29 U.S.C. 666(j), it is concluded that this penalty should be reduced to $6,000.

Respondent is a small to medium sized utility construction company with 45 employees, exclusive of family members. Its Northwest Bergen County sewer project was a rather large one.

The hazard to which it exposed three of its employees was serious. If any employees were in this excavation when its North face did collapse, death or serious physical harm could surely have resulted. However, the duration of the exposure, as far as this record reveals, was rather brief, in the neighborhood of approximately one hour.

The walls of the excavation were ultimately sloped back to correct their vertical nature.

Respondent does have a history of one previous serious trenching violation, Exhibit C-1. Lastly, it does have a safety program, but the evidence concerning it is rather meager in this record.

It is therefore concluded that a $6,000 penalty is appropriate.

## CONCLUSION

The jurisdiction of the Review Commission in this case is not contested and is established by the pleadings and Stipulations pursuant to Sections 3(3), 3(5) and 10(c) of the Act, 29 U.S.C. 652(3), 652(5) and 659(c).

Based upon the foregoing which constitutes the findings of fact and conclusions of law herein, and pursuant to Sections 10(c) and 12(j) of the Act, 29 U.S.C. 659(c) and 661(i), it is hereby

ORDERED

1. That the one-Itemed "Willful" Citation alleging a violation of 29 U.S.C. 654(a)(2) for failure to comply with the Occupational Safety and Health Standard set forth at 29 C.F.R. 1926.651(c), issued to this Respondent on November 20, 1980, is AFFIRMED.

2. A penalty of $6,000 is ASSESSED.

# NOTICE OF DECISION

Secretary v. KEN-MAR AUTOMOTIVE PRODUCTS CO.

OSHRC Docket No. 82-286

1. Enclosed is a copy of my decision. It will be filed with the Commission on October 18, 1982, and will become the final order of the Commission on November 17, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief, Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N. W., Suite 601
   Washington, D. C. 20006

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is November 17, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commisison.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

APPEARANCES:

Gary A. Boncella, Esquire, Office of the Solicitor, U. S. Department of Labor, Cleveland, Ohio, on behalf of complainant

Mr. Ken Hiudt, Cincinnati, Ohio, on behalf of respondent

## DECISION AND ORDER

BRADY, Judge: This proceeding is brought pursuant to section 10 of the Occupational Safety and Health Act of 1970 ("Act") to contest a citation and proposed penalty issued by the Secretary of Labor ("Secretary") pursuant to section 9(a) of the Act.

Prior to commencement of the hearing in this cause, the parties stipulated the manner for abatement of item 4 of the citation whereupon it was agreed that respondent would withdraw its notice contesting the citation, leaving in issue only the proposed penalties.

The Commission's authority to assess penalties is derived from section 17(j) of the Act which states it is required to find and give "due consideration" to the size

of the employer's business, the gravity of the violation, the good faith of the employer, and the history of previous violations in determining the assessment of an appropriate penalty. The gravity of the offense is the principal factor to be considered. Nacirema Operating Company, Inc., 72 OSAHRC 9/A2, 1 BNA OSHC 1049, 1971-73 CCH OSHD ¶ 15,032 (No. 4, 1972). The Commission stated in Secretary v. National Realty and Construction Co., Inc., 72 OSAHRC 9/A2, 1 BNA OSHC 1049, 1971-73 CCH OSHD ¶ 15,188 (No. 85, 1971), that the elements to be considered in determining the gravity are: (1) the number of employees exposed to the risk of injury; (2) the duration of exposure; (3) the precautions taken against injury, if any; and (4) the degree of probability of occurrence of injury.

Respondent, a remanufacturer of various auto parts, including brake shoes, water pumps and clutches, employed 18 employees in its plant area. The record discloses an inspection of June 1974 found 21 nonserious violations which were not contested. Another inspection in April 1975 revealed no violations at the facility.

Items 1 and 2 of the citation pertain to an opensided, elevated platform located in the middle of the shipping department. It was approximately 16 feet by 16 feet by 8 feet in height with a concrete floor beneath (Ex. C-1, C-2, C-3, C-4).

Complainant's evidence shows that the presence of debris, and holes in the floor of the platform, increased the hazard of falling by slipping or tripping. Testimony revealed that one employee ascends a ladder to the platform to obtain packing boxes for use the following day. He was exposed to the hazard for approximately five to ten minutes each day.

Mr. Ken Hiudt, appearing for respondent, stated that the overhead storage area was not a work station but was used only to store excess packing boxes. Upon learning of the violative conditions, respondent immediately rebuilt the storage area to comply with the cited standards.

Item 3 of the citation relates to respondent's failure to have a deluge water hose and an emergency eye wash equipped with a quick, open valve at the parts cleaning tank. The tank, used on an irregular basis, contained an acidic solution heated to approximately 200 degrees for removing grease and accumulated dirt. It was indicated that one employee, operating a crane for lowering and raising a basket of parts, was exposed to a splash hazard to the skin although protected with a face shield, apron and gloves (Ex. C-5).

Mr. Hiudt stated that at no time had the State of Ohio informed the company its system was not in conformance with the appropriate standards. He advised that a combination safety shower and eye wash station has been installed.

Item 4 was violated for failure to provide foot protection for approximately seven employees working in certain areas of the plant. The employees handled parts varying in weight from approximately one to ten pounds and, when loaded into containers, weigh from 100 to 150 pounds (Ex. C-6, C-7). The hazard would be to the foot, from a falling part or the full container, of up to waist high.

Respondent states it had not been informed by the State of Ohio regarding a foot hazard, and no injuries have been sustained as a result of its operation. Employees regularly assigned to the area are now provided safety shoes by the company.

Item 5 refers to a violation for failure to provide guarding on a stripper machine (Ex. C-8). The operator was exposed to injury to hand or forearm from the nip point between the shaft and a fixed round bar at the rear of the machine. A guard was present, however, and it would be necessary for him to reach around it to gain access to the nip point. The evidence also shows the shaft rotates at a slow speed.

Respondent points out that the machine was bought in its present guarded condition which was believed to be in conformance with safety standards.

Item 6 refers to exposed horizontal belts used with pulleys which presented a hazard to the operator's fingers. Some machines were completely guarded while others had exposed areas as shown in Exhibits C-9 and C-10. It was indicated that the probability of reaching the nip point was slight.

Mr. Hiudt states that one machine was purchased new and the others were used, but each contained an enclosed flywheel which prevents contact with the outside surface of the wheel. He contends the operator would have to purposefully go inside the cover to reach the pinch points in question. All of the machines have been completely covered.

Respondent points out that, even though it is a small company, it understands its responsibility to provide a safe and healthful workplace for all employees. In fulfilling this responsibility, it is stated that the consultative services of the State of Ohio have been utilized for many years regarding safety matters. Although it is contended the state agency at no time informed it of the hazards, which gave rise to issuance of the citation, each item was immediately abated following the inspection herein.

Weighing all the factors set forth in section 17(j) in light of the circumstances, it is determined that the following penalties are deemed fair and appropriate.

| Item No. | Amount of Penalty |
|---|---|
| 1 | $ 50 |
| 2 | $200 |
| 3 | $ 25 |

| Item No. | Amount of Penalty |
|---|---|
| 4 | $ 75 |
| 5 | $ 75 |
| 6 | $ 75 |

## FINDINGS OF FACT

1. Ken-Mar Automotive Products Co., at all times hereinafter mentioned, maintained a place of business at 2926 Exon Avenue, Cincinnati, Ohio, where it remanufactured auto parts.

2. On January 1 through February 5, 1982, authorized representatives of the Secretary conducted an inspection of respondent's plant.

3. Each day an employee retrieved cardboard packing boxes from a 16-foot by 16-foot opensided platform eight feet above a concrete floor. He was required to climb a ladder to the platform, which was littered with scrap paper, and contained floor holes. His duties were performed in approximately five to ten minutes.

4. The deluge water hose and emergency eye wash in the cleaning room was not equipped with a quick opening valve.

5. Employees working in some areas of the plant were required to handle parts of 10 or 12 pounds each and containers of parts weighing up to 250 pounds. The employees were not provided with, nor did they wear appropriate, foot protection.

6. The nip point between the rotating shaft and a fixed round bar at the rear of a stripper machine was not guarded.

7. Two horizontal V-belts, operating on one-half HP motors, and pulleys in the brake lining area were unguarded.

## CONCLUSIONS OF LAW

1. Ken-Mar Automotive Products Co., at all times pertinent hereto, was an employer engaged in a business affecting commerce within the meaning of section 3(5) of the Act, and the Commission has jurisdiction of the parties and subject matter herein pursuant to section 10(c) of the Act.

2. Respondent is, and at all times pertinent hereto, required to comply with the Act and the safety and health regulations promulgated by the Secretary pursuant to section 6(a) thereof.

3. Respondent was in violation of the standards at 29 C.F.R. § 1910.22(a)(1), § 1910.23(a)(9), § 1910.23(c)(1), § 1910.94(d)(9)(vii), § 1910.132(a), § 1910.212(a)(1) and § 1910.219(e)(1)(i), as alleged in the citation.

Upon the basis of the foregoing findings of fact and conclusions of law, and the entire record, it is ORDERED:

The citation is affirmed, and a penalty in the amount of $500.00 is hereby assessed.

Dated this 18th day of October, 1982.

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

CLEARY, COMMISSIONER:

A decision of Administrative Law Judge Henry F. Martin is before the Commission pursuant to section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). Judge Martin vacated two citations alleging violations of section 5(a)(1) of the Act [1/] which were issued by the Secretary of Labor ("the Secretary") to Gearhart-Owen Industries, Inc., Respondent. [2/] The Secretary petitioned for review of the judge's decision and I directed review on all the issues raised by the Secretary's petition, including the following:

---

1/ Section 5(a)(1), 29 U.S.C. § 654(a)(1), provides:

> Sec. 5(a) Each employer --
> (1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees.

2/ Judge Martin affirmed a third citation, which is not before the Commission on review.

> Whether the evidence establishes that Respondent violated 29 U.S.C. § 654(a)(1) by failing to provide operational shields and failing to comply with required intraline distances in storing explosives.

The Commission affirms that part of the judge's decision vacating the citation involving the alleged failure to provide operational shields. The Commission reverses that part of the judge's decision vacating the citation involving the alleged failure to comply with required intraline distances in storing explosives.

I

This case arises out of an explosion at Respondent's facility in Cleburne, Texas, where Respondent was engaged in the production of the M-213 hand grenade fuze under a contract with the U.S. Army Munitions Command. The M-213 hand grenade fuze contains a small quantity of explosive which, when detonated, in turn detonates the main powder charge in a completed hand grenade. In Respondent's production process, employees first assemble the fuze body, which consists of a striker, lever, hinge pin, spring, clip and pull ring. After the fuze body is assembled, it passes along a horizontal conveyor belt to the crimping area, where there are four crimping stations on each side of the belt, 32 to 36 inches apart. A crimping machine is located at each station. The machine consists of a cast-iron "shoe", approximately 10 to 12 inches wide and 26 to 32 inches high, which rises from the floor to just above the level of the table where the conveyor belt passes. A steel crimping head approximately one and one-half inches in diameter and 6 to 8 inches long screws into the top of the shoe. The crimping head has a 1/4-inch diameter, vertical hole in it. Each crimping machine operator is supplied with a tray of as many as 110 detonators, the parts containing the explosive material. At the crimping stage, the operator removes a fuze body from the conveyor belt, inserts the base of the fuze body into the open end of a cylindrical C-70 detonator, and then inserts the entire unit--detonator, first--into the

vertical hole in the crimping head. When the operator depresses a foot pedal, a plunger rises in the crimping head and causes a rubber washer to squeeze the open mouth of the detonator at the base of the fuze body, crimping the detonator to the fuze body like a pencil to an eraser. This completed unit, approximately 3 to 4 inches long, is then replaced on the conveyor belt and passes on successively to x-ray inspection, sealing at the crimp with glue, and packing in special trays for shipment. The trays, in turn, are placed in boxes which are then loaded onto a semi-trailer truck parked at the loading dock just outside of the work bay.

The record indicates that, after numerous repetitions of this crimping operation, the rubber washer in the crimping machine would deteriorate, either causing improper crimping or cutting the detonator and leaving part of it jammed in the crimping head. Sometimes, when part of the detonator was severed and remained lodged in the crimping head, the operator would try to remove it using a thin piece of wood like a Q-tip or toothpick. If this failed, the operator would call upon Glenn Junge, the Assembly Department Foreman, to clear the machine. Junge would unscrew the crimping head from the shoe, remove a pin which traversed the crimping head and held an inner piston in place, and remove the piston. Then, he would take out the jammed detonator, replace the rubber washer and reassemble the crimping head. One morning, Junge began to clear a jammed machine; only two were still functioning on the production line at the time. He unscrewed the crimping head, laid it across the top of the shoe, and began to tap the pin out. Suddenly, there was a green flash, followed by an explosion and a fire which engulfed the work bay. When the fire spread to the semi-trailer parked at the loading dock, perhaps three-quarters full of finished M-213 fuze units, the truck, too, exploded. Forty-nine persons were injured in the incident, four fatally.

II

In the first citation before us, we must consider whether the evidence establishes that Respondent violated section 5(a)(1) by failing to provide operational shields. 3/ The Department of Defense Contractors' Safety Manual for Ammunition, Explosives and Related Dangerous Material, DOD 4145.26M, ("DOD Safety Manual") defines "operational shield" as "[a] barrier that will protect personnel, material, or equipment from the effects of fire, fragments, or blast occurring at a particular operation."

A

Testimony at the hearing before Judge Martin established that Respondent initially submitted its contract bid to produce the M-213 hand grenade fuze through the Defense Contract Administration Services Region ("DCASR"). 4/ A DCASR safety specialist, Rodney Prows, conducted a pre-award survey of Respondent's Cleburne facility and reviewed documents submitted by Respondent in order to determine whether Respondent understood the safety requirements of the contract bid solicitation and the DOD Safety Manual. The DOD Safety Manual, which was incorporated by reference in the contract bid specifications, prescribed the use of "operational

---

3/ The citation at issue charged that Respondent:

> . . . did not furnish each of his employees employment and a place of employment which were free from recognized hazards that were causing or were likely to cause death or serious physical harm to his employees working in building no. 1, bay no. 4, the M-213 hand grenade fuze assembly line. Operational shields were not provided to reduce the exposure of employees to the effects of fire, fragments, or blasts occurring at a particular operation and to control the propagation of explosives between operations at the following locations: between employees' stations on crimping machines and between crimping operations and nearby 'unlike' operations such as x-ray inspection, packing, and crating operations.

4/ DCASR investigates companies bidding on defense contracts to assess their capability of producing in accordance with the terms of the procuring defense agency (e.g. Army, Navy, etc.). DCASR makes a recommendation to the procuring agency, but it does not enter into contracts itself.

shields." 5/ Prows' superior at DCASR, Lawrence Del Regno, later testified that, in his view, the DOD Safety Manual requires that each operation be shielded from each other and that the crimping operators be shielded from the material that they are handling. He added that such shielding can be made of any material: "It can be paper. It can be rocks. It can be--as long as the material tests out to 125 percent of the anticipated handled load--it can be of any material that will confine and restrict the blast." Prows reviewed Respondent's safety manual, its standard operating procedures manual, a plot plan of Respondent's facil-

---

5/ The DOD Safety Manual, at paragraph 603(f)(1) and (2), provides:

603. Specialized Safety

* * *

f. Operational Shields.

(1) Certain operations are hazardous and operational shields must be used for the protection of employees. The requirements for shielding cannot be clearly defined because of the great variety of circumstances that surround a given operation. The safety of operations will depend on the careful scrutiny of the work planned and the farsightedness of those responsible for safety in the establishment. Dependent upon amounts of explosives, operations being performed and other factors, shields may be constructed of concrete, steel, wood, plexiglass, or other construction materials.

(2) Operational shields for the protection of personnel shall be designed taking into account thickness, size, fastening, and location in such a manner as to protect against the effects of not less than a 25 percent overload above the expected maximum charge. In the absence of reliable data proving the adequacy of these shields, the proposed design shall be tested with at least 25 percent overload before its use is permitted in operations. Operational shields for which adequate test data is available need not be retested for each specific exposure of the same magnitude.

ity and some building drawings, including one drawing titled "Proposed M-213 Hand Grenade Fuze Production Line." The drawing depicted and identified "shields (typ)" between the individual crimping stations. It also included the notation that "Crimper that crimps detonator to fuze body is properly grounded. Crimping of detonator to fuze body is shielded to protect operator and prevent propagation to other detonators."

Following the award of the contract to Respondent, Prows returned to the Cleburne plant to conduct a safety survey. He walked the length of the assembly line (which was not yet in production), including the crimping area. Prows testified that he recalled speaking with Dave Levey, Respondent's plant manager, regarding the crimping machines, the use of the crimping head as an operational shield, and the absence of barricades between the crimping stations. When he was assured by Levey that the crimping heads had been tested by detonating a 25% overload explosive charge inside the crimping head, Prows assumed that the crimping heads had withstood the test and that they constituted adequate operational shields. Approximately three months later, Prows conducted another safety survey at the plant; the line was then in production. Among other things, Prows' subsequent report on the inspection noted the presence of a trailer at the loading dock being used in lieu of a service magazine and specifically recommended that the trailer be moved to another location which complied with intraline distance requirements. The report, though, made no further mention of operational shields.

The record indicates that, in addition to Prows' periodic surveys, DCASR had two to four quality assurance inspectors (QAIs) who were present almost full-time in the plant. The primary responsibility of a QAI is to monitor the quality of the product on the assembly line. The QAI is supposed to be familiar with the DOD Safety Manual. QAIs are also given a safety procedure evaluation checklist,

keyed to the contractor's own safety program, to make sure that the contractor follows through on its safety program.

B

In his decision, Judge Martin noted that Prows never cited Respondent for inadequate shielding in the crimping area during either of his safety surveys, even though he was well aware that there were no physical barricades between crimping stations. Moreover, Prows apparently agreed, based on Levey's statement that the crimping heads had been successfully tested, that the steel crimping heads did constitute operational shields. The judge also referred to the testimony of Prows' superior, Del Regno, who expressed confidence in Prows' judgment and acquiescence in Prows' acceptance of Respondent's interpretation of "operational shield." The judge also pointed to the fact that Respondent had purchased its equipment from and modelled its layout upon a second munitions manufacturer and that its operations and procedures were similar to those employed at another, both of which produced the M-213 fuze under contracts similar to Respondent's. Finally, the judge noted that the DCASR inspectors who were present full-time at Respondent's worksite never complained about the lack of operational shields. Accordingly, Judge Martin concluded that the Secretary did not prove Respondent's failure to provide operational shields and he vacated the citation.

C

In order to establish a section 5(a)(1) violation, the Secretary must prove: (1) the employer failed to render its workplace free of a hazard, (2) the hazard was recognized either by the cited employer or generally within the employer's industry, (3) the hazard was causing or was likely to cause death or serious physical harm, and (4) there was a feasible means by which the employer could have eliminated or materially reduced the hazard. Baroid Division of NL Indus-

tries, Inc. v. OSHRC, 660 F.2d 439 (10th Cir. 1981); St. Joe Mineral Corp. v. OSHRC, 647 F.2d 840 (9th Cir. 1981); National Realty & Construction Co. v. OSHRC, 489 F.2d 1257 (D.C. Cir. 1973); Whirlpool Corp., 79 OSAHRC 32/A14, 7 BNA OSHC 1356, 1979 CCH OSHD ¶ 23,552 (No. 9224, 1979), rev'd on other grounds, 645 F.2d 1096 (D.C. Cir. 1981); see United States Steel Corp., 82 OSAHRC 35/A2, 10 BNA OSHC 1752, 1982 CCH OSHD ¶ 26,123 (No. 77-1796, 1982). "A violation of the general duty clause cannot be sustained unless the Secretary is able (1) to establish the type of employer conduct necessary to avoid citation under similar circumstances and (b) to demonstrate the feasibility and likely utility of such conduct." Williams Enterprises, Inc., 79 OSAHRC 24/A2, 4 BNA OSHC 1663, 1666, 1976-77 CCH OSHD ¶ 21,071 at 25,361 (No. 4533, 1976). The Commission has held that "[i]t is sufficient if [a] method [of abatement] materially reduces, even though it may not eliminate, the hazard." Whirlpool Corp., supra, 7 BNA OSHC at 1360, 1979 CCH OSHD at p. 28,535.

The Secretary argues that the citation and complaint refer to the lack of operational shields both between the employee work stations and also between the crimping stage and other assembly stages along the production line; such "operational shields" clearly imply physical barriers, not the crimping heads themselves. Thus, the Secretary rejects Judge Martin's implicit finding that the crimping head constituted an operational shield. The Secretary urges that the crimping heads did not abate the hazard here, that sparks and explosions were shown to spread from and to detonators which were located outside of the crimping head, and that an explosion among the supply of detonators could spread to nearby production areas unrelated to crimping.

The Secretary also urges that he established the feasibility of barriers as an abatement method based upon: the provisions in the DOD Safety Manual; 6/ the building drawing submitted by Respondent in connection with its contract bid

depicting shields between individual crimping stations; Respondent's installation, prior to the explosion, of a 3/4-inch plywood shield, 4 feet high by 8 feet wide, between the fuze assembly area and the crimping area; and Respondent's report to the U.S. Army Munitions Command, subsequent to the explosion, that the rebuilt crimping stations were each "separated by one and one-half inch plywood."

On review, Respondent insists that it did provide operational shields in compliance with the safety requirements of the contract and the DOD Safety Manual. In Respondent's view, the record clearly shows: that the crimping took place inside the steel barrier of the crimping head; that the crimping head had satisfied the 25%-overload-of-explosives test prescribed by the DOD Safety Manual, containing the detonation and preventing fragmentation; and that the crimping head shielded the operator and prevented propagation to other detonators. Respondent charges that the Secretary did not make any showing regarding the size, height, weight or construction materials that would be necessary for effective shielding and that therefore the Secretary failed to establish the feasibility and likely utility of additonal operational shields as a means of reducing the hazard of the propagation of an explosion. Chairman Rowland and I agree with this contention. 7/

The Secretary introduced no evidence concerning the nature or design of the shielding required other than the broad generalizations contained in the DOD Safety Manual. The only evidence directly related to the feasibility of the proposed operational shields is that they "may be constructed of concrete, steel, wood, plexiglass, or other construction materials . . . [and] shall be designed taking into account thickness, size, fastening, and location in such a manner as

---

6/ See note 5 supra.

7/ Chairman Rowland would also vacate the citation for the additional reasons stated in his separate opinion.

to protect against the effects of not less than 25 percent overload above the expected maximum charge." Indeed, the Secretary fails to state whether the shields must be able to withstand 25% overload above the explosive charge in one detonator (the operators crimp one detonator at a time) or 25% overload above the explosive charge in 110 detonators (the operators are each supplied with a tray containing 110 detonators). He notes that Respondent did erect a single plywood shield between the fuze assembly area and the crimping area prior to the explosion and installed plywood between crimping stations after the explosion, but a post-explosion photograph tells little about the efficacy of this shield in the event of explosion. Even if we were to agree with the Secretary that he has established that plywood partitions are technically feasible, there is no basis in this record from which we can reasonably conclude that such partitions would actually work in the event of an accident. We conclude, then, that the Secretary has failed to meet his burden of proof on the feasibility issue. Accordingly, we affirm that part of the judge's decision vacating this citation.

III

In the second citation before us we must consider whether the evidence establishes that Respondent violated section 5(a)(1) by maintaining insufficient distance between the fuze assembly line and the trailer being loaded with completed fuzes, thereby failing to eliminate or substantially reduce the hazard of propagation of explosions between the two sites. The parties agree that the DOD Safety Manual is an appropriate source of separation criteria and other precautions for deployment of explosives, but Respondent denies that the cited operation was inconsistent with the precautions described in the manual. 8/

---

8/ The DOD Safety Manual, at paragraph 705(e), states:
705. Degree of Safety Provided by and Use of Quantity-Distance Tables

(continued on next page)

At the time of the explosion on the production line, a semi-trailer truck was parked at the loading dock adjoining the work bay. Referring to a photograph in evidence, Harrold Owen, Respondent's president, testified that the distance between the end of the loading dock and the work bay was 48 feet. 9/ Other witnesses estimated the distance as 10 feet and 20 feet. It is undisputed that Respondent's practice was to load boxes of completed fuzes onto the semi-trailer sporadically over the course of several days until it was fully loaded for shipment. Respondent's Assembly Department Foreman, Junge, recalled that, prior to the explosion, the semi-trailer had been parked at the loading dock for three or four days. He estimated that the semi-trailer was three-quarters loaded with fuzes. Owen stated that he did not know how long the semi-trailer had remained at the dock or how often it hauled fuzes from the plant.

---

8/ (continued)

* * *

> (e) Intraline Distances are the minimum permitted between any two operating buildings and/or sites within an operating line, at least one of which contains or is designed to contain explosives, except that the distance from service magazine for the line to the nearest operating building shall not be less than the intraline separation required for the quantity of explosives contained in the service magazine.

The DOD Safety Manual also defines:

> Operating Building - Any structure, except a magazine, in which operations pertaining to manufacturing, processing, handling, loading, or assembling ammunition and explosives are performed.

and

> Service Magazine - An auxiliary building of an operating line used for the intermediate storage of explosives materials. The amount of explosives is normally limited to a minimum consistent with safe, efficient production.

9/ Owen first testified that this distance was 50 to 60 feet. However, upon examining an exhibit depicting the area in question, he stated that the distance was 48 feet.

In his decision, Judge Martin noted that the DOD Safety Manual, in Table 7-D, prescribes appropriate separation distances in relation to the net weight of the explosives involved. 10/ He concluded that in order to prove the Secretary's allegation it is necessary to know both the quantity of explosives on the semi-trailer and the distance between the semi-trailer and the production line. Judge Martin, though, could not ascertain whether the distances specified in the DOD Safety Manual were exceeded since neither the exact distance involved nor the amount of explosives on the semi-trailer could be determined with accuracy. Accordingly, the judge vacated the citation.

On review Respondent endorses the judge's disposition of this item but argues in addition that regardless of the actual quantity of explosives involved the trailer was not too close to the assembly line because the minimum safe distance in this case was 30 feet and the record establishes that the trailer was at least 48 feet from the assembly line. Alternatively, Respondent argues that separation distances are not relevant in this case because by their nature they do not apply to loading operations. In support of this argument Respondent cites to paragraph 308(g) of the Manual, which exempts automotive equipment being

---

10/ Table 7-D provides as follows:

| Net Pounds of Explosives | | Distance in Feet | |
|---|---|---|---|
| Over | Not Over | Barricaded | Unbarricaded |
| (1) | (2) | (3) | (4) |
| | 50 | 30 | 60 |
| 50 | 100 | 40 | 80 |
| 100 | 200 | 50 | 100 |
| 200 | 300 | 60 | 120 |
| 300 | 400 | 65 | 130 |
| 400 | 500 | 70 | 140 |
| * | * | * | * |

loaded with explosives from the intraline distance requirements as long as the combined weight of explosives on the automotive equipment and in the building does not exceed the maximum allowed in the building. 11/ Respondent points out that at the time of the explosion Respondent's quantity-distance limit on the line was 400 pounds and there is no probative evidence that the total weight of the explosives on the semi-trailer and in the work bay exceeded 400 pounds.

We find, based on the testimony of Respondent's president, that the trailer was a maximum of 48 feet from the production building. We further find, based on Table 7-D of the Manual, that a minimum safe distance between the trailer and the building would have been 60 feet. As the judge noted, the record does not establish the quantity of explosives in the trailer or the building and therefore calculations which depend on these figures cannot be made. However, uncontradicted evidence in the form of the Manual shows that regardless of the quan-

---

11/ Paragraph 308(g) of the DOD Safety Manual provides:

> 308. Siting of Ammunition and Explosives Facilities
>
> * * *
>
> g. Spotting Rail Cars and Automotive Equipment at Buildings. Rail cars and automotive equipment containing ammunition or explosives, which are nearer than intraline distances to an explosives operation or operating building shall be included in computations as part of the explosive limits of the operation or operating building. This is not intended to permit cars or trucks containing explosives and ammunition to be used as service magazines and to be placed at less than intraline distances from the explosive operation or operational building. The total quantity within the cars and building shall not exceed the maximum permitted in the building or rail cars by the quantity-distance requirements.

Quantity-distance requirements would here establish, in relation to the amount of explosives on the operating line, the necessary separation between the operating building and other inhabited buildings, passenger railroads, and public highways inside and outside of plant boundaries.

tity of explosives at either location, the minimum safe distance between explosive stores not separated by a barricade was 60 feet. 12/

We reject's Respondent's argument that the wall of the production building constitutes a barricade and therefore the 30-foot minimum separation of barricaded sites would be the appropriate standard. The Manual defines "barricade" as an "intervening approved barrier." 13/ "Intervening" implies something that lies between two entities, not something that is a constituent of one of them. Therefore, barricaded separation standards are not relevant to this case. Accordingly, we conclude that the distance separating Respondent's trailer and production building was not sufficient to eliminate or substantially reduce the hazard of explosion propagation.

Respondent argues in the alternative that no particular separation of trailer and building was necessary in this case because the trailer was being laded, and lading operations, by their nature, require proximity. Respondent points to provisions in the Manual which specifically exempt lading operations from separation requirements. It may be true that lading operations must sometimes be exempted from separation requirements. However, the cited trailer was being used for temporary storage, not for loading. The record establishes that this trailer remained at the dock even while not being filled and that it was Respondent's practice to leave trailers at the dock for several days during lading. At the time of the explosions the trailer had been at the dock for three to four days

---

12/ See Table 7-D, note 10 supra.

13/ The DOD Safety Manual defines "barricade" as follows:

> An intervening approved barrier (natural or artificial), of such type, size and construction as to limit in a prescribed manner, the effect of an explosion on nearby buildings or exposures.

and nights. A plot plan of Respondent's plant indicates the trailer could have been removed to either a "Service Magazine Area for Motor Trucks" or a "Storage Magazine Area," yet Respondent offers no reason why the semi-trailer was not removed to one of these locations while not actually being loaded. We agree with the DCASR safety specialists that an intermittent loading operation which extends over several days and nights constitutes temporary storage. 14/

The Secretary originally characterized this violation as willful, but in his petition for discretionary review sought to have the violation classified as serious. We note that all the elements of a serious violation under section 17(k) of the Act, 29 U.S.C. § 666(j), are included in the elements of a section 5(a)(1) violation. Thus, although the citation did not explicitly allege that the violation was serious as well as willful, an allegation of seriousness was implicit in the section 5(a)(1) charge. Our finding that the violation was likely to cause death or serious harm is equivalent to a finding under section 17(k) that the violation gives rise to a substantial probability of death or serious harm. Accordingly, we shall affirm the citation as a serious violation. 15/

---

14/ On review, Respondent also contends that both citations at issue must be vacated pursuant to section 4(b)(1) of the Act. Section 4(b)(1) provides:

> Nothing in this Act shall apply to working conditions of employees with respect to which other Federal agencies . . . exercise statutory authority to prescribe or enforce standards or regulations affecting occupational safety or health.

The Commission rejected this argument in an earlier decision in this case. Gearhart-Owen Industries, Inc., 2 BNA OSHC 1568, 1974-75 CCH OSHD ¶ 19,329 (No. 4263, 1975), pet. dism., No. 75-1392 (D.C. Cir. Sept. 29, 1975). That ruling became the "law of the case." The rule of the law of the case is a rule of practice based on sound policy that when an issue is once litigated and decided, that should be the end of the matter. Barret v. Baylor, 457 F.2d 119 (7th Cir. 1972). Accordingly, the Commission need not address this already-decided issue and Commissioner Cottine and I decline to do so.

15/ In cases arising under section 5(a)(2) of the Act, 29 U.S.C. § 654(a)(2), where a violation is alleged to be willful but is not proven to be so, the plead-

(continued on next page)

We have considered the factors enumerated in section 17(j) of the Act, 29 U.S.C. § 666(i) on the issue of penalty assessment. Although it is not clear how large an employer Respondent is, at least 50 people were employed on the M-213 fuze contract. The contract itself was for $1.3 million. Respondent had no previous record of violation. As to gravity, the following elements must be considered: (1) the number of employees subjected to the hazard, (2) the duration of exposure, (3) the precautions taken against injury, and (4) the degree of probability that an injury would occur. Turner Co., 76 OSAHRC 108/A2, 4 BNA OSHC 1554, 1976-77 CCH OSHD ¶ 21,023 (No. 3635, 1976), rev'd on other grounds, 561 F.2d 82 (7th Cir. 1977). In this instance, (1) some 50 employees were exposed; (2) the duration was a few days; (3) no precautions were taken; and (4) the probability of injury was relatively high. Respondent exhibited good faith in its cooperation during the investigation.

Accordingly, the judge's decision is reversed in part and the Secretary's citation alleging a failure to comply with intraline distance requirements in storing explosives is affirmed as a serious violation. A penalty of $700 is assessed.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: NOV 22 1982

---

15/ (continued)

ings may be amended to allege a serious violation if the parties have expressly or impliedly consented to try whether the violation was serious. E.g., Toler Excavating Co., 75 OSAHRC 76/C8, 3 BNA OSHC 1420, 1975-76 CCH OSHD ¶ 19,875 (No. 2637, 1975). In this case, however, because an allegation of seriousness was implicit in the citation, it is not necessary to amend the pleadings to find the violation to be serious.

COTTINE, Commissioner, dissenting in part:

The Secretary has established the feasibility and likely utility of providing operational shields in the form of solid partitions to separate employees engaged in assembling hand grenade fuzes from each other and other employees working nearby. Accordingly, I dissent from the majority's decision vacating the citation relating to operational shields.

The judge observed, "it is apparent that the shielding should have been some type of a plywood shield or barrier between each operator." Nevertheless, Commissioner Cleary's lead opinion concludes that, even assuming the Secretary established the technical feasibility of plywood partitions, "there is no basis in this record from which we can reasonably conclude that such partitions would actually work in the event of an accident." As to technical feasibility the evidence is overwhelming. The Secretary relied on partitions actually depicted by the Respondent in its proposed drawings of October 13, 1972 (Exhibit C-3) and on plywood partitions actually installed after the explosion as examples of the type of protection required. The Secretary also relied on the testimony of DCASR safety specialist Prows that plexiglass partitions would be feasible. Prows stated that plexiglass partitions were already in use in a similar Defense Department facility in Kansas.

The evidence also establishes that partitions would "actually work," i.e., they would materially reduce the cited hazards. In addition, Chairman Rowland acknowledges that "[t]he Secretary presented general evidence that barriers could prevent the propagation of explosions."1/ Nonetheless, the majority finds no reasonable basis to conclude that partitions between the crimping stations would be likely to significantly

---

1/ The magnitude of the explosion hazard involved in this case is evident from the four deaths and 45 other injuries that occurred following the July 10, 1973 explosion.

reduce the potential death and injury toll in the event of an explosion. However, common sense when applied to this factual record indicates the value of partitions in reducing the spread of an explosion in a munitions factory. Indeed, the Defense Department's safety manual incorporated into the Respondent's contract required that "too many consecutive operations not be permitted in the same room or building without adequate dividing walls, fire walls or operational shields . . . ."[2/] Furthermore, the Secretary presented evidence of the utility of partitions. DCASR safety specialist Prows testified without contradiction that either plexiglass or plywood of sufficient strength would be effective to stop the spread of sparks and explosions. Prows' superior, DCASR safety manager Del Regno, testified that in his opinion the absence of shields between the individual workers in the Respondent's operation is a recognized hazard and that he never would have approved the contract award to the Respondent unless shielding had been shown on its drawings.

The fact that operational shields were a requirement of the Defense Department's safety manual, which the Respondent agreed to follow, also supports the conclusion that shields would contribute to employee safety. In fact, the Respondent did not claim that partitions would be ineffective; it merely questioned the adequacy of the Secretary's proof. Its basic argument was that the crimping heads had adequately contained an explosion during testing and were sufficient operational shields under Defense Department requirements. That defense is without merit

---

2/ U.S. Dep't of Defense, DOD 4145.26M, Contractors Safety Manual for Ammunition, Explosives and Related Dangerous Material § 603(b)(1) (Oct. 1968)(Joint Exhibit 1-H).

and has not been accepted by any of the Commissioners.[3/] Thus, the Respondent did not rebut the Secretary's evidence of the utility of partitions.[4/]

---

3/ In support of that defense the Respondent's special products manager testified that the Respondent had tested a crimping head with an explosive charge 40% greater than the maximum expected charge and found that the head did not fragment, although it did crack. In his opinion, the crimping head controlled the explosion. However, that test was conducted with the parts assembled as they would be during normal operations. Specifically, the detonator was in position for crimping. By contrast, the catastrophe that precipitated this inspection occurred during repairs while supervisor Junge was attempting to remove a detonator from a crimping head. The Respondent's test explosion did not establish that the crimping head would contain the explosion of a detonator being removed during repairs. It also was established that sparks could be generated and cause an explosion of detonators outside the crimping heads, e.g., in the trays containing up to 110 detonators at the employees' stations awaiting crimping. Clearly, the crimping heads were not the type of operational shields that were required. The Respondent failed to rebut the Secretary's showing that solid partitions separating each operator from nearby employees were feasible and would have substantially reduced the hazards.

4/ The majority notes that the photographic evidence does not indicate that the single plywood shield in place before the explosion effectively reduced the extent of the explosion. (That shield had been between the fuze assembly area and the crimping area.) However, it cannot be concluded from this evidence that partitions separating the operators from each other and from the rest of the plant would have been ineffective. Obviously, partitions capable of arresting the initial spread of the detonation would be effective means of reducing the hazard.

ROWLAND, Chairman, concurring in part and dissenting in part:

I concur with Commissioner Cleary in affirming the judge's decision vacating the citation alleging a failure to provide operational shielding. The Secretary presented general evidence that barriers could prevent the propagation of explosions, but he did not specify the type of barriers he alleges Respondent should have used. A section 5(a)(1) violation cannot be found unless the Secretary specifies the steps the employer could have taken to avoid citation and demonstrates the feasibility and likely utility of those steps. National Realty & Construction Co. v. OSHRC, 489 F.2d 1257 (D.C. Cir. 1973). I would also vacate that citation for for the additional reasons stated infra. I dissent from the majority's decision to reverse the judge and affirm the Secretary's citation alleging a failure to comply with intraline distance requirements in "storing" explosives.

Respondent argues that both citations at issue must be vacated pursuant to section 4(b)(1) of the Act[1/] because the Department of Defense ("DOD") has regulated the cited working conditions. I agree.[2/] Section 4(b)(1) precludes the application of the Act to working conditions that are the subject of regulation by another agency. Dillingham Tug and Barge Corp., 10 BNA OSHC 1859, 1982 CCH OSHD ¶ 23,493 (No. 77-4143, 1979), appeal filed, No. 82-7552 (9th Cir. August 31, 1982). As

---

1/ Section 4(b)(1), 29 U.S.C. § 653(b)(1), provides in pertinent part:

> Nothing in this Chapter shall apply to working conditions of employees with respect to which other Federal agencies . . . exercise statutory authority to prescribe or enforce standards or regulations affecting occupational safety or health.

2/ Since § 4(b)(1) is a jurisdictional requirement rather than an affirmative defense, it may be raised and considered at any stage of proceedings. U.S. Air, Inc. v. OSHRC, No. 81-1528 (4th Cir. July 2, 1982); Columbia Gas of Pennsylvania, Inc. v. Marshall, 636 F.2d 913, 918 (3rd Cir. 1980). Since I believe that the Commission may, in the exercise of proper discretion, correct a prior erroneous ruling on a jurisdictional issue, I do not join the majority's "law of the case" discussion in footnote 15. I will consider Respondent's arguments on § 4(b)(1). See Messenger v. Anderson, 225 U.S. 436 (1912); Potomac Passengers Association v. Chesapeake & Ohio Railway Co., 520 F.2d 91, 95 n. 22 (D.C. 1975).

the lead opinion so graphically demonstrates, the Secretary's entire case was predicated on allegations that Respondent failed to comply with certain provisions of the DOD Safety Manual. But Respondent was required by DOD regulation to comply with that very manual. Gearhart-Owen Industries, 2 BNA OSHC 1568, 1569 & n.1, 1974-75 CCH OSHD ¶ 19,329 at p. 23,113 & n.1 (No. 4263, 1975). Moreover, DOD representatives constantly inspected Respondent's operation to assure that the company was in compliance with the requirements of the manual. Thus, I conclude that section 4(b)(1) deprived the Secretary of jurisdiction to issue the citations.

Moreover, the intraline distance citation should be vacated for the additional reason that the record does not support the determination of exact intraline quantity-distance requirements allegedly violated. I would further find that the Table 7-D intraline distances are not applicable in any event, because paragraph 308(g) permits spotting of trailers near operating buildings for shipping purposes so long as the maximum amount of explosives in the spotted trailer and on the production line did not exceed what would be permitted pursuant to the quantity-distance requirements--in this case, 400 pounds.

The majority reverses the judge's finding that no accurate intraline distances could be determined and resolves the unknown weight of the explosives on the semi-trailer and the production line, allegedly exceeding permissible intraline distances, by making findings which are unsupported by the record. First, the majority holds that the applicable distance requirements to protect against "the hazard of explosion propagation" are governed by the "unbarricaded distance" requirements of Table 7-D. However, it is the Secretary's burden to prove that the applicable distances were not met because there was no intervening barricade within the meaning of Table 7-D. Lacking proof in the record as to what is the applicable criteria for determining whether a barricade exists, the majority dis-

misses Respondent's arguments that the wall of the production building is an "intervening approved barricade" within the meaning of the DOD Safety Manual which permitted the trailer to be spotted as close as 30 feet to the building. The majority's justification for such a finding is simply its assertion that "'intervening' implies something that lies between two entities, not something which is a constituent part of one of them."

By concluding that the appropriate minimum distances are guided by the "unbarricaded" distance specifications, the majority adroitly skirts the problem addressed by the judge--the lack of probative evidence that intraline distances for "barricaded" situations were violated. Indeed, if the 48-foot distance found by the majority to be the length of the dock from the building is accepted as the distance of the trailer from the operating building, there is no proof that the minimum "barricaded" distance of Table 7-D was violated.

I further note that the presence of the "wall" between the operational area and the loading area apparently well-served the purposes of a "barricade" since there was no mass detonation of explosives in the trailer simultaneously with the explosion in Bay #4. In fact, the trailer exploded some 20 minutes after the initial explosion and only when a fire finally reached it.

Turning now to the alternative ground on which I would vacate--the applicability of paragraph 308(g)--the majority dismisses Respondent's argument on this point by concluding that the trailer was used for "temporary storage, not for loading," apparently, because in the opinion of the DCASR safety specialists, intermittent loading which extends over several days "constitutes temporary storage." 3/

---

3/ While I agree that paragraph 308(g) does not permit motor vehicles and railcars to be used in lieu of service magazines, I further note that it was Respondent's undisputed practice that if fuses accumulated and could not proceed to shipment, then they were stored in a magazine.

I do not find the testimony of Prows and Del Regno summarily referred to by the majority to be compelling. First, neither Prows nor Del Regno testified that the cited trailer under the conditions existing at the time of citation was a service magazine. They offered only general opinion testimony to the effect that a trailer loaded with explosives and not moved for "several days" or until "ultimately loaded" would be a "service magazine". While neither Prows nor Del Regno gave further substantiation or qualification to the term "several days," I note that Prows made the contradictory statement that even "one day would be too long." Finally, Prows did not make a specific objection that the trailer was indeed in violation of the quantity-distance requirements during his prior inspection. Rather, Prows only observed that "a loaded trailer would exceed" the limits. Given the lack of evidence regarding the amount of explosives on the trailer, the length of time the trailer remained at the dock is not relevant, even under the majority's test. In sum, there is no evidence that the trailer remained at the dock without fuses being loaded onto it and without proceeding to shipment. Therefore, I conclude that the trailer was spotted at the building for loading and shipping purposes rather than for the intermediate storage of explosives.

Finally, I question the majority's unstated acceptance that the Secretary has shown how moving the trailer back and forth to a service magazine during loading would enhance worker safety and be a useful means of abatement. Had the explosives not been in the trailer during the process of loading, they could have been in the plant or loading area and Respondent would have had to comply with the explosive limits not shown to have been exceeded, 400 pounds. Paragraph 308(g) clearly contemplates that it is permissible to have a completely loaded trailer at the dock provided that the total quantity limits for the building are not exceeded. Obviously, the very hazards feared by the majority

could nevertheless occur with the accumulation of fuses in the production building or at the final loading of the trailer at the dock in the manner permitted by paragraph 308(g).

DECISION ON REMAND

MARTIN, Judge:

On August 15, 1973, the Secretary of Labor, complainant, cited Gearhart-Owen Industries, Inc., respondent, for certain alleged violations of Section 5(a)(1) of the Occupational Safety and Health Act of 1970, hereinafter referred to as the Act. Respondent was issued two citations, one alleging a serious violation and the other alleging two willful violations. A notification of proposed penalty was also issued

on the same date wherein a civil penalty of $20,700 was proposed. The issuance of the citations followed an investigation into a fire and explosion which occurred at respondent's Cleburne, Texas, plant on July 10, 1973, in assembly bay no. 4, building no. 1, where respondent had varying numbers of employees engaged in the production of M-213 hand grenade fuzes.

Following the issuance of a complaint which was answered by respondent's counsel, Judge Risteau (now retired) issued his order of dismissal, vacating the citations on the ground that Section 4(b)(1) of the Act [1/] deprived the Review Commission of jurisdiction over the work being performed by respondent's employees. The Review Commission set aside the Judge's order and remanded the case for further proceedings. Thereupon, respondent filed a petition for review with the Court of Appeals for the District of Columbia, however, on September 29, 1975, the court dismissed the petition for review because the Commission's remand was of an interlocutory nature. The case was then assigned to the undersigned Judge who held a hearing on the merits beginning on October 27, 1976.

---

1/ Section 4(b)(1) of the Act reads:

> "Nothing in this Act shall apply to working conditions of employees with respect to which other Federal agencies, and State agencies acting under section 274 of the Atomic Energy Act of 1954, as amended (42 U.S.C. 2021), exercise statutory authority to prescribe or enforce standards or regulations affecting occupational safety or health."

Respondent is a Texas corporation with its main office in Fort Worth, Texas, however, in 1969, respondent built its Cleburne explosives plant to service government contracts relating to the manufacture of explosives. The Cleburne plant has been engaged in the production, inspection, and packaging of various explosive items for the Department of Defense, one of which is the M-213 hand grenade fuze, which operation was being carried on in assembly bay no. 4 of building no. 1. Respondent submitted its bid to the U.S. Army Munitions Command, (see exhibit A to the stipulation of facts identified as joint exhibit no. 1) on August 28, 1972, and on November 15, 1972, respondent was notified that it had been awarded the contract to manufacture M-213 fuzes. (Award/contract DAAA09-73-C-0119 by the U.S. Army Munitions Command identified as exhibit D in joint exhibit no. 1.)

Pre-award and post-award surveys were conducted by representatives of the Defense Contract Administrative Services Region, Dallas (hereinafter referred to as DCASR), the last safety survey of respondent's Cleburne plant prior to the explosion and fire having been made on May 3, 1973. Exhibit H, attached to the aforementioned stipulation, is a copy of the DoD Contractor's Safety Manual for Ammunition, Explosives, and Related Dangerous Materials, dated October 1968, (DoD 4145.26M) covering safety practices to be used in industrial plants by contractors involved with contracts for explosives. The foreword of this manual reads as follows:

> "This manual is issued under the authority of and in accordance with the Department of Defense Instruction 4145.26, subject: DoD Contractors' Safety Manual for Ammunition, Explosives, and Related Dangerous Materials, dated June 21, 1968. It provides uniform safety practices to be used in industrial plants and facilities by contractors involved with contracts for ammunition, explosives and related dangerous material of the DoD, Military Departments, and Defense Agencies (hereinafter referred to collectively as 'DoD Components') or other activities as specified in the contract. This manual is a compilation of safe practices and standards used by DoD Components and other recognized national agencies. Questions on interpretation and recommendations for amendments to this manual should be submitted to the Cognizant DoD Components through the procuring contracting officer as appropriate."

Armed Services Procurement Regulation 7-104.79 (exhibit G in joint exhibit 1) requires contractors to comply with DoD manual 4145.26M in effect on the date of the solicitation of the contract as it relates to explosives.

At approximately 11:30 a.m. on July 10, 1973, an explosion and fire occurred in assembly by no. 4 of building no. 1. According to the accident report filed by respondent's plant manager (exhibit J attached to joint exhibit 1) the presumed cause of the accident was the explosion of a detonator in a crimping head caused by friction in an attempt to remove the pin from the crimper head. An employee, Mr. Junge, the bay foreman or supervisor, was called by one of the crimper operators because of a hung detonator in the crimping machine and he had removed the crimping head from the crimper and was attempting to

remove the pin to free the fuze when the detonator exploded. Following the initial explosion other detonations took place thereby resulting in a fire. A total of 41 employees were injured, including four who subsequently died. Mr. Junge, himself, lost an arm in the explosion.

CITATION FOR SERIOUS VIOLATION

Citation no. 1 alleges as follows:

> "On July 10, 1973, this employer did not furnish each of his employees employment and a place of employment which were free from recognized hazards that were causing or likely to cause death or serious physical harm to his employees working in building no. 1, bay no. 4, the M-213 hand grenade fuze assembly line. Repairs were being performed on a crimping machine in an explosive location in building no. 1, bay no. 4, M-213 grenade fuze assembly area, without adequate required safety precautions being taken which would reduce the possibility of the ignition of explosives accumulated in the crimping area."

Complainant's exhibit C-3 is a proposed plot plan dated October 13, 1972, showing respondent's M-213 fuze production line. According to the evidence presented there were eight crimping machines, four located on each side of a conveyor belt, however, all of the machines were not in operation at the same time because of numerous malfunctions. Mr. Junge testified that the floor was swept each day and washed down weekly, and that the machines were inspected and cleaned each day. DCASR inspectors were on the premises each day and stood in close proximity to the aforementioned crimping stations. The replacement of neoprene washers in the crimping heads was considered by Mr. Junge to be routine maintenance.

According to Mr. Junge and several of the employees under his supervision, the principal malfunction was the shearing off of the detonators which would leave a portion stuck in the crimper. This was apparently a daily or frequent occurrence and when the operator herself could not easily remove the severed portion from the machine with a wooden object, similar to a Q-tip, Mr. Junge would be summoned to correct the problem. The evidence indicated that Mr. Junge used an iron bar about five-eighths of an inch in diameter to remove the jammed detonator. One of the employees stated that she had seen Mr. Junge use a screwdriver and pliers in accomplishing this task.

Although partitions or shields were drawn on the proposed plot plan in the crimping machine area of the assembly building, none had been installed at the crimper stations or between the crimper stations and other operations as of the date of the accident.

Mr. Junge testified that he had never seen any written instructions pertaining to the removal of hung detonators; that no procedures had been posted in this connection; that he had never been instructed not to conduct this type of repair in the assembly area; that he had never received any training in this work; that he had never been instructed as to what type of tools to use in this sort of operation and further that DCASR representatives had never offered any instructions or advice regarding this matter.

On the morning in question, Mr. Junge had been called to clear a crimping machine between the conveyor belt and the back wall. After he had taken the crimper head off, he laid the head on the crimper and had started to tap out the pin. This was the last thing that Mr. Junge remembered.

Mr. Junge was the foreman over workers in the assembly bay, averaging about 40 or 45, on the date of the explosion, including up to eight at the crimper stations. Several of the crimper machine operators testified that the fuzes being assembled occasionally would come down the conveyor belt faster than they could be handled, resulting in the fuzes and detonators to be placed in their laps or put in boxes on the floor. The employees applying the sealant to the detonators stated that there was always an excess number of fuzes on the belt and that they could not always keep up with the steady flow.

Respondent has been charged with violating the provisions of the general duty clause of the Act, section 5(a)(1),[2/] because adequate safety precautions were not taken to reduce the possibility of ignition of explosives accumulated in the crimping area where the repairs were being performed.

---

2/ Section 5(a)(1) of the Act reads as follows:

> "Each employer shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees."

Mr. Prows, a compliance officer with the Occupational Safety and Health Administration, was formerly a safety specialist with DCASR, and in March and May of 1973, he made two safety surveys of respondent's Cleburne plant. Mr. Prows, prior to being employed at DCASR, was with the US Army Materiel Command where he received nine months of safety training and took a six weeks course in explosive safety. He also was employed at the Kansas Army Ammunition plant where he monitored the contractors' program dealing primarily with explosives. Mr. Prows was of the opinion that respondent's failure to remove the jammed crimper head away from the assembly line to effect the repairs necessary to return it to its proper condition constituted a recognized hazard likely to cause death or serious physical harm to the employees. He was also of the opinion that respondent's failure to instruct the operators and supervisors as to safety procedures in the event of a crimper malfunction would be a recognized hazard. He was also of the view that the failure of respondent's foreman, Mr. Junge, to remove explosives from the immediate area prior to attempting to remove the hung detonator would be a recognized hazard likely to cause death or serious physical harm to employees in the work place.

Mr. Del Regno, a safety specialist with DCASR since 1965, formerly had 28 years of experience in dealing with explosives while he was attached to the US Army Corps of Engineers. He was an instructor in explosives at Fort Belvoir for two and one-half years. Mr. Del Regno testified that in his opinion an attempt to remove a hung detonator

from a crimper head in the crimping area without clearing explosives from the area would constitute a recognized hazard likely to result in death or physical harm to the employees.

Respondent has contended that the evidence does not support the allegation that "repairs" were being performed on the crimper head. It is contended that Mr. Junge's actions were merely in the nature of routine maintenance. Respondent has also taken the position that the evidence did not reveal that there were any required safety precautions which would have reduced the possibility or probability of ignition of explosives.

After carefully considering respondent's contentions it is concluded that Mr. Junge's efforts to remove the hung detonator from the crimper head fell within the category of repairs. After reviewing Webster's definition[3/] and cases cited in Words and Phrases, Volume 36A, it can be seen that there is very little difference, if any, in the words repair and maintenance. In fact, maintenance usually includes the act of keeping something in repair. The words maintenance and repair are often used synonymously. As indicated by Webster, "to repair" means to fix

---

3/ Webster's New World Dictionary, 2nd College Edition, defines repairs as "to put back in good condition after damage, decay, etc.; mend; fix; to renew; restore, revive; to amend; set right; remedy; the act, process, or work of repairing; state of being repaired, or fit for use; ....

or mend something or restore an object to its original condition. This is precisely what Mr. Junge was attempting to do when the explosion occurred. The crimper operators were only allowed to remove a cut detonator from the crimper head if it came out easily, otherwise they were under instructions to call upon their supervisor, Mr. Junge, who had to disassemble the crimper to cure the malfunction.

Respondent contended that complainant failed to show that there were adequate safety precautions which could have been taken to reduce the possibility of ignition of explosives. There is no merit to respondent's contention. The measures described by the compliance officer, Mr. Prows, and the DCASR safety specialist, Mr. Del Regno, if followed, would undoubtedly have made the work place safer in that it would have minimized the danger of an explosion resulting in physical injury to employees. In addition to the procedures described by them is the use of nonsparking tools 4/ in an effort to correct the hung detonator which

---

4/ Section 603(k) entitled Safety Hand Tools in DoD Contractor's Safety Manual for Ammunition, Explosives, and Related Dangerous Material (DoD 4145.26M) further identified as exhibit H in joint exhibit 1, provides as follows:

(1) "Safety hand tools are constructed of wood or other nonsparking or spark resistant materials such as bronze, lead, beryllium alloys and "K" Monel metal. Properly maintained, nonferrous hand tools shall be used for work in locations which contain explosives or hazardous concentration of flammable dusts, gases, or vapors, subject to ignition by sparks. Hand tools or other implements used in [Footnote continued on following page]

would appear to be a matter of prime importance when working in an explosive location, much more so than the wearing of certain types of clothing which is a matter covered by respondent's operational manual (joint exhibit no. 2). On May 3, 1973, Mr. Prows made a safety survey of respondent's facilities (see exhibit I, attached to joint exhibit no. 1) and one of his recommendations was worded as follows:

> "Maintenance personnel should be provided safety hand tools constructed of nonsparking materials and all ferrous tools should be removed from the line. A tag system should be developed to certify that equipment has been decontaminated before ferrous tools are allowed to be used."

The corrective action which was taken by respondent's program manager was set out in a letter to DCASR dated May 28, 1973, and indicated that nonsparking tools had been ordered and were due to be in use by July 1, 1973. Apparently respondent's supervisor, Mr. Junge, had not

---

4/ [Footnote continued from preceding page]

the vicinity of dangerous materials must be handled carefully and kept clean. All tools shall be checked in before beginning work and checked out at its completion.

(2) If the use of ferrous metal hand tools is required because of strength characteristics, the immediate area shall be free from exposed explosives and other highly combustible materials subject to ignition by spark."

been instructed with respect to the necessity for using safe hand tools along the assembly line and especially in the crimping area.

It is concluded that respondent violated the provisions of section 5(a)(1) of the Act and that the infraction was serious within the purview of section 17(k) of the Act. Accordingly, the serious citation issued on August 15, 1973, should be affirmed. After considering the size of respondent's operation, its good faith, previous history, and gravity of the violation, it is concluded that the $700 penalty, as proposed by complainant, is appropriate and will satisfy the public interest.

CITATION FOR WILLFUL VIOLATION

Citation no. 2 (page 1) alleging a willful violation reads as follows:

> "On July 10, 1973, this employer did not furnish each of his employees employment and a place of employment which were free from recognized hazards that were causing or were likely to cause death or serious physical harm to his employees working in building no. 1, bay no. 4, the M-213 hand grenade fuze assembly line. Operational shields were not provided to reduce the exposure of employees to the effects of fire, fragments, or blasts occurring at a particular operation and to control the propogation of explosives between operations at the following locations: between employee stations on crimping machines and between crimping operations and nearby 'unlike' operations such as x-ray inspection, packing, and crating operations."

It is respondent's contention that because of the size and strength of the crimping machine heads they actually served as operational shields to reduce the exposure of employees to the effects of fire, fragments, and blasts and would control the propagation of explosives in the crimping area of assembly bay no. 4.

Admittedly there were no dividing walls, barriers, partitions, or cubicles separating the crimping machine operators from each other or separating the crimping area from other sections further down the assembly line such as the inspecting, sealing and packing departments. It is noted that so called "typical" shields were drawn in the crimping area on the proposed plot plan of the M-213 fuze production line, dated October 13, 1972 (complainant's exhibit C-3). The location of the crimping machine operators as of the date of July 10, 1973, however, did not conform to the proposed layout but was moved closer to the hardware assembly area and further away from the inspection area. There was a plywood partition or shield between the crimping area and the hardware assembly area.

Mr. Wells, formerly plant superintendent, testified that the Cleburne plant manager, Mr. Levey, requested that he test the crimping heads[5/] for its effectiveness as an operational shield (see complainant's exhibit C-49). He testified that a typical crimping head was

---

5/ Respondent's exhibit R-4 is one of the crimping heads taken from the production line which was in the fire and explosion at respondent's Cleburne plant on July 10, 1973, and is in fact, one of the crimping heads taken from a crimping machine which was purchased from the Penguin Industries in the fall of 1972.

tested with an E99 blasting cap, detonating a C-70 detonator, which indicated that this would simulate a 140 percent overload and that the head controlled the explosion.[6/] He stated further that while the head did have a crack in it it did not fragment.

Complainant presented two witnesses in support of his contention that there were no operational shields to reduce the exposure of the employees and to control the propagation of explosives between the various operational units. Mr. Prows, who was formerly a DCASR safety specialist, testified that he was aware of the fact that there were no plywood shields in place in the crimping area (Tr. 328). He discussed this matter with the plant manager, Mr. Levey, and was convinced by Mr. Levey that the crimper head itself had been tested and that it would serve as an operational shield (Tr. 326). Mr. Prows testified, "I assumed that it had been tested and that it was adequate" (Tr. 327). Mr. Prows stated that he had made two post-award safety surveys of respondent's Cleburne plant in March and May of 1973.[7/] In neither survey did he mention any inadequate shielding in the crimping area.

---

6/ There was some question in the record as to whether an E99 blasting cap was used or a no. 8 cap.

7/ His statement as to a March inspection was probably incorrect as exhibit I in joint exhibit no. 1 shows that a survey was made by him on February 13, 1973. The May 1973, inspection date was on May 3, 1973.

Mr. Del Regno, when questioned as to whether a recognized hazard would be created by the absence of shields between the individual workers, replied: "absolutely" (Tr. 609). He quoted as his authority the green manual (DoD 4145.26M), exhibit I to the stipulation in joint exhibit 1. Section 603(f) thereof provides as follows:

> "(1) Certain operations are hazardous and operational shields must be used for the protection of employees. The requirements for shielding cannot be clearly defined because of the great variety of circumstances that surround a given operation. The safety of operations will depend on the careful scrutiny of the work planned and the forsightedness of those responsible for safety in the establishment. Dependent upon amounts of explosives, operations being performed and other factors, shields maybe constructed of concrete, steel, wood, plexiglass, or other construction materials.
>
> (2) Operational shields for the protection of personnel shall be designed taking into account thickness, size, fastening, and location in such a manner as to protect against the effects of not less than a 25 percent overload above the expected maximum charge. In the absence of reliable data proving the adequacy of these shields, the proposed design shall be tested with at least this 25 percent overload before its use in permitting operations. Operational shields for which adequate test data is available need not be retested for each specific exposure of the same magnitude."

Attention is also invited to Section C of the invitation to bid (see exhibit A in joint exhibit 1). At page 15 thereof the following appears:

> "Special requirements: Care should be taken to ground equipment and operator, and to accomplish the assembly of detonator to fuze in such a manner as to shield the operator from fragments and to prevent propagation to other detonators."

On cross examination, however, Mr. Del Regno recalled a discussion he had with Mr. Prows relative to respondent's theory of shielding which in effect meant that a crimping head of substantial size, made of steel, would constitute an operational shield pursuant to the terms of the contract. He indicated that that would be a common means of shielding (Tr. 679). After having his memory refreshed by reading portions of a deposition he gave in 1974, Mr. Del Regno testified that he was satisfied with Mr. Prows' acceptance of the conditions and that he had full confidence in Mr. Prows (Tr. 687).

Mr. Harrold D. Owen, president of respondent corporation, testified that he reviewed the fuze assembly operations at the Penguin plant in Pennsylvania prior to his purchase of their equipment. He advised that his fuze assembly operations at the Cleburne plant were substantially the same as those conducted at Penguin - - except that the Cleburne plant was a little roomier. He testified that Penguin had no physical barriers of any kind between the crimper operators or between the crimping area and other related activities such as inspection, sealing, or packing. Penguin's procedures and methods of operation were adopted at the Cleburne plant according to Mr. Owen. He also indicated that he visited the Lynx plant and found that their operations and procedures were similar to those in effect at Cleburne.

It should be noted that the citation and complaint do not charge respondent with a failure to install a dividing wall, barricade, barrier, plywood partition, or cubicle, to surround the individual crimper operators or to isolate the crimping area from the other areas such as those encompassing x-ray inspection, sealing, and the packing of fuzes.

From the gist of the testimony presented by complainant it is apparent that the shielding should have been some type of a plywood shield or barrier between each operator. The complaint, however, merely refers to an operational shield to protect employees from the effects of fire, fragments or blasts. From an examination of section 603(f) of the green manual previously referred to, it can be seen that a shield can be made of concrete, steel, wood, or plexiglass (underlining for emphasis).

DCASR inspectors were in respondent's plant on a daily basis for the purpose of determining safety items as well as the quality of fuzes being produced. Complainant's exhibit 3 which was labelled "proposed" M-213 fuze production line does show the words "shields (TYP.)" in the crimping area but whether this proposed plan, dated October 13, 1972, was ever submitted in that form by respondent to the US Army Munitions Command is not clear. The record does not reveal any instance where any DCASR representative ever complained to respondent about any lack of operational shields, nor were any mentioned in the post-award inspection reports.

On the basis of the entire record it must be concluded that complainant has not established by reliable and probative evidence that respondent failed to provide operational shields to reduce exposure to its employees in the Cleburne plant and that citation no. 2, page 1, should be vacated.

Citation no. 2 (page 2) of the alleged willful violation provides as follows:

> "On July 10, 1973, this employer did not furnish each of his employees employment and a place of employment which were free from recognized hazards that were causing or were likely to cause death or serious physical harm to his employees working in Building #1, Bay #4, the M213 hand grenade fuze assembly line. The trailer located at the loading dock of Building #1 and used as a service magazine for storage of completed M213 grenade fuzes waiting shipment was so located that a violation of the required intraline distances existed. Since the trailer was not separated from the final assembly bay, the bay quantity limit of 50 pounds of explosives was exceeded, creating a serious hazard to employees working in the bay area."

Mr. Junge, foreman in the assembly bay no. 4, testified that a semi-trailer was backed up to the loading dock where wooden crates of assembled fuzes were loaded, not continuously, but on a daily basis. He estimated that there was a three or four day accumulation of fuzes. It was also his guess that the trailer was about three-fourths full. He did not think that there was any accumulation of fuzes inside the building - no more than four or five boxes. Mr. Junge had no idea as

to the weight of the fuzes which were in the trailer. He also indicated that if there was any build up of fuzes inside the assembly area, they were moved to a magazine about a quarter of a mile away (Tr. 111).

Mr. Junge advised that there were always up to three government inspectors in the assembly bay area and that they were thorough in observing the operations going on in the crimping area and in other areas of the assembly bay. When Mr. Junge was asked whether the government inspectors discussed safety procedures with him, he replied,

> "they would mention sometimes if those crates built up in the building that I needed to move them to a magazine. If the trailer was loaded and it was waiting on another spot they would say that you need to get them out of here, they would call my attention to it, and we would move them out." (Tr. 118, 119)

When questioned about the July 10th date Mr. Junge stated:

> "I don't recall. I wouldn't think so, but like I stated earlier, the trailer was about three quarters full, so I wouldn't think there would be any reason for it to be overloaded. I really don't know. I just really don't." (Tr. 120)

Mrs. Jennie Mannan, one of the crimper operators testified that she had noticed the truck or trailer at the dock but did not know how often it was moved out. It was her opinion that not all of the boxes went straight into the truck but that some went into a storage magazine or somewhere else (Tr. 224).

Complainant's senior compliance officer, Mr. Rutherford, testified that during the investigation that followed the accident, he questioned Mr. Levey about the number of fuzes which had been assembled since the date of the last shipment. He was given the figure of 60,520 of completed units which at an amount of 31.8 grains per unit would amount to approximately 275 pounds of explosives (Tr. 459). Mr. Rutherford stated that the 60,520 fuzes had not been shipped out, according to Mr. Levey.

Relative to the distances involved, the record is anything but clear. The length of the trailer, according to Mr. Junge, was estimated to be 40 or 45 feet. The assembly bay area was 48 feet by 48 feet. The loading dock which was between the assembly bay area and the trailer was estimated to be all the way from 10 feet to 60 feet. Mr. Rutherford thought the distance was ten feet. Mr. Junge thought that it was 14 feet. Mr. Del Regno estimated the distance to be 20 feet and Mr. Owens felt that the distance was 50 or 60 feet. Obviously Mr. Owen is a very interested witness, however, he did state that the loading dock had been the subject of several alterations or modifications. Apparently no one during the investigation found it necessary to measure the size of the loading dock.

The citation and complaint herein charges respondent with a violation of the "required intraline distances" because of the position of the trailer at the loading dock and its use as a service

magazine. Intraline line distance is not defined in the green manual (DoD 4145.26M) however, the definition of intraline separation (at page 2-2) is as follows:

> "The distance to be maintained between any two operating buildings and/or sites within an operating line, at least one of which contains or is designated to contain explosives, except that the distance from service magazine for the line to the nearest operating building shall be not less than the intraline separation required for the quantity of explosives contained in the service magazine."

In order to prove this allegation it is necessary to know the distance between the explosives and the operating line as well as the quantity of the explosives. Here there is no reliable or probative evidence of either item. The distance involved is indefinite and the amount of explosives is a mere speculation. Mr. Junge thought the trailer was approximately three quarters full, however, he later stated over a three or four day period the load would build up from empty to three quarters of a load (Tr. 97).

If the figures given by Mr. Levey to Mr. Rutherford are correct and fuzes produced for the three days prior to July 10th totalled 31,500, then the amount of explosives would be about 143 pounds. If we assume that all of the 60,520 units were in the trailer on July 10th then the number of pounds of explosives would be approximately 275. If we consider that the trailer was three quarters full and apply the data taken from page 2 of the award/contract (exhibit E in joint

exhibit 1) showing that there were 360 fuzes in each of the 300 boxes (assuming there was 40 foot capacity trailer) then there would be 108,000 fuzes on board, containing approximately 490 pounds of explosives. There is, of course, no proof that all of the M-213 fuzes went into the semi-trailer.

From all the evidence at hand the weight of the explosives in the trailer or on the operating line cannot be determined with any degree of accuracy. Therefore it cannot be ascertained whether the intraline distances of table 7D in the green manual (DoD 4145.26M) were exceeded since the exact distances are not known and since the amount of explosives in the trailer could not be established.

Respondent is also charged with violating the bay quantity limit of 50 pounds of explosives because of the trailer not being separated from the assembly bay. The evidence, however, shows that there was a wall between the bay and the loading dock where the trailer was located. It was blown out however at the time of the accident. The evidence revealed that the assembly bay limit was changed from 50 pounds to 400 pounds as a result of the grant of an interim waiver (see respondent's exhibit R-2) dated July 5, 1973. The waiver was granted after discussions between respondent's officials and a DCASR representative, Mr. Del Regno. There is no credible evidence to support a finding that there was an amount of explosives on hand exceeding the assembly bay limit on the date of July 10, 1973.

It should be noted at this point that the citation alleges that respondent violated the "required intraline distances". When the DCASR

specialist, Mr. Del Regno, testified he recalled a discussion with respondent's plant manager, Mr. Levey, over which table should be applied in setting the maximum load for the building - whether it was the intraline distance table (table 7D of the green manual) or the inhabited building distance (table 7E of the green manual). Mr. Levey had been contending that the intraline distance requirement should prevail. Mr. Del Regno at that time and also as of the date of the hearing insisted that the inhabited building distance table (table 7E) was the applicable distance to be used (Tr. 692, 693; 700, 701). It should be noted, however, that the citation does not charge respondent with a violation of the inhabited building distance requirement.

Based upon all the evidence in the record it is concluded that respondent did not violate the general duty clause of the Act since the facts do not establish that the intraline distance requirement was violated and since it was not established that respondent exceeded the assembly bay limit in building no. 1 on July 10, 1973.

Citation no. 2 alleged that respondent committed two willful violations, one relating to the alleged failure to provide operational shielding and the other dealing with the alleged infraction of the intraline distance requirement and the quantity bay limit of explosives. In view of the conclusions reached herein, a finding on willfulness is not necessary. However, it is concluded that there is no basis on this record for the willful label which was placed upon the citation.

It is crystal clear that DCASR safety officials and respondent's plant management discussed the matter of operational shielding and

it was apparently agreeable with DCASR personnel for respondent to operate the crimping machines which they had purchased from Penguin with the crimping heads themselves being considered as a type of shield. Further it is also apparent that discussion was also had relative to increasing the quantity limit of explosives in the assembly bay area. This resulted in the grant of an interim waiver raising the bay limit from 50 pounds to 400 pounds. It is inconceivable to find a respondent charged with a willful violation where good faith discussions have been carried on between it and DCASR safety officials who were present in the plant on a daily basis, checking on safety items and the quality of the product being manufactured (Tr. 719, 720).

Section 17(a) of the Act imposes a severe penalty (up to $10,000) on any employer who "repeatedly or willfully" violates the Act, or any standard or rule. In order to establish a willful violation it must be shown that the employer's action was a conscious, intentional, deliberate, voluntary decision. See Intercounty Construction Company v. OSHRC, 522 F.2d 777 (4th Cir. 1975), F.X. Messina Construction Company v. OSHRC, 505 F.2d 701 (1st Cir. 1974), and the United States v. Dye Construction Company, 510 F.2d 787 (10th Cir. 1975). The evidence here falls far short of establishing "willfulness" on the part of respondent.

Respondent has renewed its motion to dismiss the complaint and vacate the citations for lack of jurisdiction under section 4(b)(1) of the Act. Respondent has called attention to the many safety procedures, practices, and rules which contractors, performing under DoD contracts,

must follow in safeguarding personnel; the periodic governmental surveys and inspections; and the training and expertise of the DCASR safety specialists in the field of explosives as compared with the lack of explosive safety training for OSHA investigators. Respondent also stresses the fact that employees in contractor owned plants are assured of a higher degree of safety when DoD contractors enforce their rules or standards than would be possible under OSHA where there are no standards covering ammunition or explosives. Although there is substantial evidence in the record to support respondent's convincing argument the undersigned Judge is obligated to follow the Review Commission's previous ruling on this question.

At the outset of the hearing respondent moved to dismiss the complaint and citations because of complainant's failure to comply with the particularity requirement set forth in section 9(a) of the Act. At no time during the pendency of this proceeding did respondent move for a more definite statement. Respondent's motion is here denied. Respondent also moved for a dismissal because of the fact that complainant's attorney acted as counsel for DCASR during the taking of certain depositions. This motion is here denied. Counsel for several of the affected employees also moved to dismiss the proceeding because of a conflict of interest. This motion was also denied.

Based upon the entire record, the following findings and conclusions are made:

## FINDINGS AND CONCLUSIONS

1. Respondent is and, at all times material hereto, was engaged in a business affecting commerce within the meaning of section 3(5) of the Act.

2. The Review Commission has jurisdiction over the parties and subject matter involved in this proceeding.

3. Respondent is a Texas corporation, having employees engaged in the business of manufacturing ammunition and explosives at its Cleburne, Texas, plant and on July 10, 1973, was engaged in manufacturing M-213 hand grenade fuzes pursuant to its contract with the US Army Munitions Command.

4. On July 10, 1973, respondent failed to furnish its employees a place of employment free from recognized hazards likely to cause death or serious physical harm to its employees in that its foreman was permitted to perform repairs on a crimping machine head in the crimping area of assembly bay no. 4 without undertaking adequate safety precautions to reduce the possibility of ignition of explosives which had accumulated in the vicinity of the crimping area, thereby violating section 5(a)(1) of the Act.

5. That the aforementioned violation constituted a serious violation with the purview of section 17(k) of the Act and a penalty of $700 is found to be appropriate and in the public interest.

6. That it has not been established by reliable and probative evidence that respondent willfully violated section 5(a)(1) of the Act

by failing to comply with required intraline distances and by failing to abide by the assembly bay explosives limit.

## ORDER

Based upon the foregoing findings and conclusions and the record as a whole, it is ORDERED that:

1. Citation no. 1, alleging a serious violation, issued on August 15, 1973, be and the same is hereby affirmed and a penalty of $700 is hereby assessed against respondent.

2. Citation no. 2, alleging willful violations, issued on August 15, 1973, be and the same is hereby vacated as well as the penalties proposed therefor.

3. This proceeding be terminated.

DECISION

Before MORAN, Chairman; VAN NAMEE and CLEARY, Commissioners.

CLEARY, Commissioner:

On March 15, 1974, Judge William J. Risteau issued his decision and order in this case, dismissing and vacating the three citations in issue, because under section 4(b)(1) of the Occupational Safety and Health Act of 1970 (29 U.S.C. §651 et seq., hereinafter referred to as "the Act") the Commission lacked jurisdiction over the work being performed. The citations alleged one serious and two willful violations of section 5(a)(1) of the Act.

On April 15, 1974, I directed that the decision and order be reviewed by the Commission pursuant to section 12(j) of the Act in order to determine whether the Secretary was without jurisdiction to issue the citations because of section 4(b)(1) of the Act.

The Commission has reviewed the Judge's rulings and has considered the entire record. We do not adopt the Judge's decision and order.

On November 15, 1972, respondent, a Texas corporation, was awarded a contract by the United States Army Munitions Command for the manufacture of hand grenade fuzes. During the fulfillment of this contract an explosion occurred on July 10, 1973, in respondent's Cleburne, Texas, plant. An inspection of the respondent's worksite by the authorized representatives of the Secretary ensued. As a result of this inspection, three citations were issued to respondent by the Secretary on August 15, 1973, along with a notification of proposed penalty for $20,700.

Following the timely filing of all pleadings by both parties, the respondent, on February 22, 1974, moved to dismiss all three citations on the grounds that under section 4(b)(1) of the Act it is not subject to the Act. The propriety of the granting of this motion is now before this Commission.

I.

Both the wording and the purpose of section 4(b)(1) of the Act must be examined in order to decide the issue before us. Section 4(b)(1) provides:

> Nothing in this Act shall apply to working conditions of employees with respect to which other Federal agencies . . . <u>exercise statutory authority to prescribe or enforce standards or regulations affecting occupational safety or health</u>. (Emphasis added).

Respondent claims exemption from the Act by virtue of the above section and the fact that respondent is a contractor with the Department of Defense [hereinafter DOD] and hence subject to safety

regulations promulgated by the DOD.[1/] The Secretary concedes that the safety regulations promulgated by the DOD cover the same working conditions for which respondent was cited. In addition, the Secretary concedes that the respondent's worksite was in fact subject to the DOD safety regulations.

The Secretary, however, maintains that the presence of DOD safety regulations does not preclude the Secretary's action in this case. We agree with the Secretary.

In support of its position, the respondent places emphasis on the language of this Commission in Mushroom Transportation Co., No. 1588 (November 7, 1973). Specifically respondent relies upon the following language in Mushroom:

> Once another Federal agency exercises its authority over specific working conditions, OSHA cannot enforce its own regulations covering the same conditions. Section 4(b)(1) does not require that another agency exercise its authority in the same manner or in an equally stringent manner.

As noted above the Secretary concedes that the DOD, in promulgating safety regulations and incorporating said regulations in its contract

---

1/ The Armed Services Procurement Regulation provides in part:

> The following clause shall be inserted in all contracts which may involve the . . . manufacture . . . of ammunition and explosives.
>
> * * *
>
> The Contractor shall comply with the DOD Contractor's Safety Manual for Ammunition, Explosives and Related Dangerous Materials, (DOD Manual 4145.26 M), in effect on the date of the solicitation for this contract, as it relates to ammunition and explosives, and any other additional or more stringent requirements included in the schedule of this contract. 32 CFR §7.104-79(a).

with respondent, has exercised statutory authority.[2/] Thus, on first glance, Mushroom would appear to apply to the instant facts and thereby support respondent's assertion of exemption under section 4(b)(1) of the Act.

Closer examination of the policy and purposes behind section 4(b)(1) of the Act leads us to reject respondent's "litmus paper" application of Mushroom to the instant facts. Rather, in order for preemption under section 4(b)(1) of the Act to occur, the exercise of statutory authority by a Federal agency must be pursuant to enabling legislation the purpose of which was to affect occupational safety and health.[3/] In other words, any analysis of the applicability of section 4(b)(1) to a given situation does not terminate upon a finding that the agency in question, under color of statute, prescribes or enforces standards or regulations that affect occupational safety and health. Further examination is required. The Congressional purpose in granting

2/ See note 1, supra and the accompanying text.

3/ This "purpose test" as applied by this Commission in Fineberg Packing Co., No. 61 (March 22, 1974) seems to be a better approach than that urged by the Secretary. The Secretary would require an express grant of statutory authority to affect occupational safety and health. We believe a "purpose test" is a better approach since it speaks to the essence of preemption under §4(b)(1) of the Act as envisioned by Congress. The Secretary's argument is concerned more with the form rather than the substance of the statutory authority involved. See note 4, infra and accompanying text.

Moreover if we adopted the Secretary's position we would have to reverse our position in the Fineberg case. It is obvious that in Fineberg there was an "express" grant of authority to affect occupational safety and health. But that "express" grant was not for the purpose of protecting employees, rather its purpose was to protect consumers from the dangers of adulterated or unwholesome products by regulating working conditions in the plants where the products were produced.

an agency the power to affect occupational safety and health must be examined to determine whether this statutory purpose, supporting an agency's action, is to assure safe and healthful working conditions for the benefit of employees.

This interpretation of section 4(b)(1) of the Act finds ample support in the legislative history of the Act. In debate over the scope of exemption under section 4(b)(1) of the Act, Congress only referred to those acts the purpose of which was to assure safe and healthful working conditions for the benefit of employees.[4/]

Examination of the nature of the statutory authority under which the DOD prescribed regulations affecting occupational safety and health leads to the inescapable conclusion that the respondent's work-site was subject to the Act. The Armed Services Procurement Regulation (hereinafter ASPR) requires contractual inclusion of safety standards in all contracts with the DOD involving the manufacture of ammunition and explosives.[5/] Thus, respondent was contractually required to conform to DOD safety regulations.

The ASPR was promulgated by the DOD by virtue of the statutory authority granted it under 5 U.S.C. §301 and 10 U.S.C. §2202.[6/] 5 U.S.C. §301 provides:

> The head of an Executive department or military department may prescribe regulations for the government of his department, the conduct of its employees, the

4/ For example, only acts such as the Federal Metal and Non-Metallic Mine Safety Act were discussed. Staff of Senate Comm. on Labor & Public Welfare, 92d Cong. 1st Sess., Legislative History of the Occupational Safety and Health Act of 1970, 1018-20, 1037 (Comm. Print 1971).

5/ See note 1, supra.

6/ DOD Directive 4105 30 (March 11, 1959).

> distribution and performance of its business, and the custody, use, and preservation of its records, papers, and property. This section does not authorize withholding information from the public or limiting the availability of records to the public.

In addition, 10 U.S.C. §2202 provides:

> Notwithstanding any other provision of law, an officer or agency of the Department of Defense may obligate funds for procuring, producing, warehousing, or distributing supplies, or for related functions of supply management, only under regulations prescribed by the Secretary of Defense. The purpose of this section is to achieve the efficient, economical, and practical operation of an integrated supply system to meet the needs of the military departments without duplicate or overlapping operations or functions (emphasis added).

Both the above sections are administrative in nature, giving the Secretary of Defense authority to promulgate rules and regulations for the purpose of insuring an operation of the DOD in furtherance of its defense mission. Admittedly, industrial accidents in plants of contractors who manufacture munitions for the DOD would likely impede the smooth operation of the DOD's procurement activities. Nevertheless, the DOD's ability to insure a continuous flow of munitions by requiring DOD contractors to conform to occupational safety and health standards does not deprive the Secretary of Labor of jurisdiction to issue citations for violations of the Act occurring at the contractor's worksite. Neither of the two sections under which the ASPR was promulgated evidences a Congressional purpose that is necessarily consonant with the purpose of the Act. Consequently,

the DOD's exercise of its contractual authority under the ASPR does not exempt respondent's worksite from the coverage under the Act.

The contract clause required under ASPR §7-104.79 7/ contains the following provision:

> Nothing contained herein shall relieve the Contractor from complying with applicable Federal, State and local laws, codes, ordinances and regulations (including the obtaining of licenses and permits) in connection with the performance of this contract (emphasis added). 8/

The presence of such a provision is an indication of the continued vitality of legislation whose specific purpose is to affect occupational safety and health.

Finally, if we adopt respondent's position that the mere promulgation of safety standards by the DOD and inclusion of such standards in defense contracts preempts the Act's coverage under section 4(b)(1), we would be tacitly declaring section 16 of the Act meaningless. Section 16 of the Act provides:

> The Secretary, on the record, after notice and opportunity for a hearing may provide such reasonable limitations and may make such rules and regulations allowing reasonable variations, tolerances, and exemptions to and from any and all provisions of this Act as he may find necessary and proper to avoid serious impairment of the national defense.

The above section clearly indicates that Congress intended the Act to apply to defense contractors, such as respondent. If the Act does not apply to defense contractors, of what purpose is a grant of authority

---

7/ 32 CFR §7.104-79(a).

8/ This clause recognizes implicitly and preserves any obligations that may exist under the Walsh-Healey Act, 41 U.S.C. §35-45. The OSHA standards are operative under the Walsh-Healey Act. See 41 CFR Part 50-204. By virtue of section 4(b)(2) of OSHA, the enforcement process of OSHA is added to the enforcement procedures of the Walsh-Healey Act. H. Rep. No. 91-1765, 91st Cong. 2d Sess. 33 (1970). Of course, section 4(b)(1) does not affect the jurisdiction of the Walsh-Healey Act.

to the Secretary to grant variations, tolerances, and exemptions in the interest of national defense? It is implicit in this section that the objective of national defense is not necessarily consonant with job safety or health. Thus, reading the Act as a whole, we reject respondent's claim that section 4(b)(1) renders the Act inapplicable to its worksite.

Inasmuch as the Secretary has conceded that the DOD safety regulations cover the same working conditions for which respondent was cited, it is necessary to distinguish our holding in this case from our holding in Southern Pacific Transportation Co., No. 1348 (November 15, 1974).

In Southern Pacific, we held that the Department of Transportation's (DOT) prescription and enforcement of safety standards covering some working conditions in the railroad industry did not mandate an industry-wide exemption under section 4(b)(1). Rather, we held that exemption occurs only for the specific working conditions that the DOT has undertaken to regulate pursuant to its statutory authority to regulate working conditions for the benefit of employees.

The DOD has exercised statutory authority in regulating the specific working conditions for which respondent was cited. But, as we noted above,[9/] the enabling legislation under which the DOD acted does not have a purpose that is consonant with that of the Occupational Safety and Health Act. It is this element that distinguishes this case from Southern Pacific.

The purpose behind the enabling legislation under which the DOT regulates working conditions in the railroad industry[10/] is the assurance of safe and healthful working conditions for the benefit of employees. The DOD, however, regulates the working conditions at defense contractors' worksites

---

9/ See pp. 5-7, supra.
10/ Federal Railway Safety Act of 1970, 45 U.S.C. §421 et seq.

pursuant to enabling legislation that is designed to facilitate the administration of the department's defense mission. Consequently, both the Department of Labor and the Department of Defense may, under color of statute, regulate respondent's working conditions in order to achieve their respective missions.

We find no difficulty in holding that respondent was subject to both the Act and the ASPR. If application of the Act to the respondent's worksite seriously impairs the national defense, respondent may make an application to the Secretary under section 16 for relief from any or all provisions of the Act. This ability to apply for relief from the Act not only fosters the purpose of the Act itself but also fosters the purpose of the administrative sections under which the ASPR was promulgated.

II.

Respondent also urges exemption under section 4(b)(1) of the Act based upon the existence of the DOD Explosives Safety Board and DOD Instruction 5030.52 (April 28, 1972). Both the above are inapplicable to this case.

The DOD Explosives Safety Board was created on October 23, 1971, pursuant to authority vested in the Secretary of Defense by 10 U.S.C. §172.[11/] Reference to this enabling statute indicates that Congress authorized the creation of such a board in order to prevent "hazardous conditions from arising to endanger life and property inside or outside of <u>storage reservations</u>" (emphasis added).[12/] Respondent's plant was

11/ DOD Directive 5154.4 (October 23, 1971).
12/ 10 U.S.C. §172.

not a storage reservation. Moreover, respondent was a private manufacturer, in a privately owned building, merely under contract with the DOD. The DOD directive creating the Explosives Safety Board provides:

> The provisions of this Directive apply to the Military Departments and Defense Agencies, hereinafter referred to as the DOD Components, worldwide and cover facilities under United States jurisdiction located within the United States and overseas wherever ammunition and explosives are manufactured, tested, handled, developed, reworked, transported, stored or disposed of while under the custody of the DOD (emphasis added).

Since the munitions in respondent's plant were not under the custody of the DOD, the Explosives Safety Board had no jurisdiction over respondent's worksite. Consequently, we find respondent's contention that the Explosives Safety Board preempts the Secretary of Labor's jurisdiction over respondent to be without merit.

Respondent's reliance upon DOD Instruction 5030.52 is clearly misplaced. This instruction is an intradepartmental instruction to all military departments and defense agencies to comply with section 19 of the Act.[13/] Section 19 of the Act requires heads of Federal agencies to establish and maintain occupational safety and health programs consistent with the standards promulgated under section 6 of the Act. Any programs initiated in compliance with section 19 of the Act apply only to Federal employees. Any regulations promulgated under DOD Instruction 5030.52 have no application to respondent's employees and consequently will not prevent application of the Act to respondent's worksite.

13/ DOD Instruction 5030.52 (April 28, 1972).

Accordingly, it is ORDERED that the Judge's decision be set aside and this case be remanded for further proceedings consistent with this decision.

FOR THE COMMISSION

William S. McLaughlin
Executive Secretary

Dated: FEB 21 1975

MORAN, Chairman, Dissenting:

The majority has once again taken crystal ball in hand, gazed into 29 U.S.C. § 653(b)(1), and discovered language which is not there, viz., that the Occupational Safety and Health Act is subordinate to other Federal laws only where there is a policy or purpose in such other laws to include employees in the class of persons to be protected thereunder. This interpretation of § 653(b)(1) not only circumvents and expands the jurisdictional

limitation set forth therein but it transfers statutory safety responsibility from a government agency experienced in a particular safety area (in this case explosives) to an agency with no experience whatsoever in explosives. I pointed out the foolhardy nature of such a position in Secretary v. Fineberg Packing Company, Inc., 7 OSAHRC 405, 408-410 (1974).

If Congress intended that such overlapping Federal law or standard have a purpose of protecting employees, the wording of § 653(b)(1) would no doubt have stated that the Act does not apply to "Federal agencies . . . [that] exercise statutory authority to prescribe or enforce [occupational safety or health] standards . . . ."

Congress, however, inserted the terms "occupational safety or health" after the words "regulations affecting." This carefully worded phrase effectively says that the jurisdiction of this Act is preempted by any regulation statutorily promulgated by a Federal agency other than the Department of Labor which affects occupational safety or health. The statute does not say that such a regulation must have employee protection as its primary purpose. It plainly excludes the application of this Act where another Federal agency has a regulation which "affects" occupational safety or health. If a sophisticated safety program to prevent an explosives plant from blowing up doesn't affect the occupational safety and health of the employees working therein, then a roof isn't a floor,[14/] shall doesn't mean may,[15/] and Secretary doesn't mean Commission.[16/]

14/Secretary v. S.D. Mullins Co., Inc., 4 OSAHRC 1415 (1973).
15/Secretary v. Chicago Bridge & Iron Co., (Order of Remand) ____ OSAHRC ____ (Docket No. 224, December 26, 1974).
16/Secretary v. H.K. Porter Co., Inc., 11 OSAHRC 53 (1974).

The Secretary has conceded, and the majority likewise finds, that by virtue of the Armed Services Procurement Regulations and its Safety Manual for Explosives the Department of Defense has exercised its statutory authority to prescribe or enforce standards or regulations which affect occupational safety and health and that such regulations apply to the working conditions of respondent's employees. This is all that the wording of § 653(b)(1) requires for proof of exemption from applicability of the Act. Respondent has thus established all the elements necessary to bring it within the purview of the exemption, and the Judge's decision should therefore be affirmed.

In several earlier cases,[17/] I set forth in detail the policy arguments in support of a strict construction of the language of § 653(b)(1). This case well illustrates the absurdity of requiring compliance with overlapping governmental regulations. The Department of Defense safety standards by which respondent was governed are detailed precautionary measures designed to prevent the same kind of hazards which motivated the Congress to enact this law.[18/] The Department of Defense has as its background extensive experience and expertise with the manufacture of explosives. The Department of Labor, on the other hand, with no demonstrated expertise in this area, in fact provides no specific regulations for the conditions which were the

17/ Secretary v. Fineberg Packing, supra; Secretary v. George A. Hormel & Co., 11 OSAHRC 725 (1974); Secretary v. Southern Pacific Railroad, ____ OSAHRC ____ (Docket No. 1348, November 14, 1974).

18/ Indeed, § 100 of the DOD Safety Manual for Explosives declares as one of its purposes the safeguarding of personnel.

subject of the citation. It alleges only noncompliance with the general duty requirement[19/] in that respondent failed to provide a workplace free from recognized hazards.

Moreover, the majority's statement that finding respondent exempt from the Act would render § 16 of the Act, 29 U.S.C. § 665, meaningless is without merit. Obviously, explosives manufacturing does not constitute the only industry which contracts with the Department of Defense. Section 16 of the Act applies to a whole multitude of Defense contractors who manufacture such things as airplanes and tanks and uniforms, build roads and airstrips and buildings, and supply food, equipment and many other things.

19/29 U.S.C. § 654(a)(1).

| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>GEARHART-OWEN INDUSTRIES, INC.,<br>Respondent. | OSHRC DOCKET NO. 4263 |

OSHRC EXECUTIVE SECRETARY
JUDGE'S DECISION REC'D MAR 15 1974
FINAL ORDER ON APR 15 1974

ORDER OF DISMISSAL

On August 15, 1973, Complainant issued three Citations to Respondent, a manufacturer of minitions, alleging violations of Section 5(a)(1) of the Occupational Safety and Health Act of 1970 (29 USC 651 et seq., hereinafter called the Act). Penalties totalling $20,700 were proposed. In due course Respondent made known its intent to contest the Citations, and a Complaint and Answer were filed.

Following a Prehearing Conference the parties entered into a limited Stipulation of Facts, and Respondent filed a Motion to Dismiss charges under the Act on the basis of Section 4(b)(1) of the Act, which provides as follows:

> "Nothing in this Act shall apply to working conditions of employees with respect to which other Federal agencies..... exercise statutory authority to prescribe or enforce standards or regulations affecting occupational safety or health."

Specifically, Respondent maintains that its workplace is operated in accordance with safety Regulations promulgated by the Department of Defense pursuant to statutory authority, thereby bringing Section 4(b)(1) into play.

5-17

Review of the Stipulation and the documents attached to it[1/] substantiates Respondent's position. It was awarded a contract to manufacture certain hand grenade fuzes for the United States Army in accordance with an Invitation to Bid which incorporated by reference (Exhibit A, page 13) portions of the Armed Services Procurement Regulations (ASPR) dealing with "Safety Precautions for Ammunition and Explosives". The ASPR is considered to be a regulation of the Secretary of Defense promulgated pursuant to applicable Statute (Exhibit K).

Section 7-104.79(b) of the ASPR requires compliance with Department of Defense Manual 4145.26M, a safety manual for DOD contractors. (Exhibit H) This is a detailed and lengthy book of instructions in safety matters, pertinent portions of which were, as appears in the Stipulation, followed by Respondent in performing the work which gave rise to the allegations contained in the Citations referred to above.

On these facts the undersigned must find that jurisdiction under the Act does not lie with respect to the work being performed in Respondent's workplace under the contract referred to in the preceeding paragraphs. It is therefore ORDERED that the Citations dated August 15, 1973, be dismissed and that the proposed penalties be vacated.

WILLIAM J. RISTEAU
JUDGE

Dated: MAR 15 1974

1/ The documents attached to the Stipulation will be referred to as "Exhibit ___".

NOTICE OF DECISION

Secretary of Labor v. Thunderbolt Drilling, Inc.
OSHRC Docket No. 81-1798

1. Enclosed is a copy of my decision. It will be filed with the Commission on October 21, 1982, and will become the final order of the Commission on November 22, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is November 22, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

Louis G. LaVecchia
Administrative Law Judge

| v. | : | Docket No. 81-1798 |
| | : | |
| THUNDERBOLT DRILLING, INC. Rig #52 | : | |

DECISION ON REMAND

Appearances: U.Sidney Cornelius, Jr., Esquire, for the Complainant.

George R. Carlton, Jr., Esquire, for the Respondent.

By order of the Review Commission dated September 10, 1982 this proceeding was remanded to the undersigned for further proceedings with respect to the alleged failure to post for the benefit of employees the OSHA notice required under the standard set forth at 29 CFR 1903.2(a)(1).

This was described as an "other" violation in Citation No. 2. The "serious" violations described in Citation No. 1 are no longer in issue.

The posting violation was affirmed as a de minimis delict in my decision filed with the Commission on August 11, 1982.

The Commission properly points out that noncompliance with a regulation that implements a specific statutory requirement cannot be properly characterized as de minimis, citing appropriate authorities. It also reminded that a civil penalty is mandatory for violation of any of the posting requirements.

The evidence of record respecting the alleged violation of the posting requirement is as follows: The compliance officer stated that during the opening conference and the following inspection of the work site he asked the tool pusher [foreman in charge] if he had an OSHA notice informing employees of the right to a safe and healthful work place, and "he told me he did not." He then added that he confirmed the absence of the notice during his walk-around inspection. Furthermore, he stated that no penalty was proposed for the violation. (Tr. 19,20).

The respondent's part owner and general manager, when asked to address the question of the missing OSHA notice, stated that "OSHA posters were bought at least twice for every rig that we have." His counsel began a question with respect to the notices, in the following manner: "As far as you know were they --" at which point the witness replied, "They were posted at the time." Thus, under one interpretation he was adding an addendum to the attorney's leading question, stating that as far as he knew the notice was posted. Under a stricter interpretation on his answer, he is stating that the notice was posted at the time. (Tr. 42).

Any conflict in the above statements must be resolved in favor of the government in view of the fact that the compliance officer was specifically looking for the notice and did not find it, and, of course, the tool pusher had stated that the notice was not posted. The respondent's evidence was vague in the sense that its part owner was not really sure that the notice had been posted in this particular instance. For example, viewing his statements in the most favorable light, it will be seen that he did not

say that he at any time actually saw the notice properly posted. In view of the matter at risk his testimony would also be more likely to show bias. Weighing these factors I find that the testimony of the compliance officer must be given greater weight than that of the respondent's witness. A violation of the posting regulation is specifically found.

The characterization of the violation found will be changed from de minimis, as shown in my original decision, to non-serious, in accord with the authorities cited by the Commission in its remand order, and a civil penalty of $1 will be assessed in order to comply with the mandate of the Act. Consideration of the elements shown in section 17(j) of the Act leads me to conclude that no higher penalty would be warranted.

I conclude that the respondent violated 29 CFR 1903.2(a)(1).

## Order on Remand

Item 1 of Citation No. 2 is affirmed as a non-serious violation, and a civil penalty of $1 is assessed.

DIRECTION FOR REVIEW AND REMAND ORDER

The petition for discretionary review filed by the Secretary of Labor is GRANTED under 29 U.S.C. §661(i) and Commission Rule 92(a), 29 C.F.R. §2200.92(a).

The Secretary takes exception to the judge's action in reducing the characterization of a violation of 29 C.F.R. §1903.2(a)(1) from nonserious to de minimis. That regulation requires that employers post a notice of employee protections and obligations under the Occupational Safety and Health Act of 1970, 29 U.S.C. §§651-678.[1/] The effect of characterizing the violation as de minimis is to preclude both an abatement requirement and a penalty assessment. Combustion Engineering, Inc., 77 OSAHRC 182/A2, 5 BNA OSHC 1943, 1977-78 CCH OSHD ¶22,241 (No. 76-2210, 1977).

---

1/ 29 C.F.R. §1903.2(a)(1) states:

> Each employer shall post and keep posted a notice or notices, to be furnished by the Occupational Safety and Health Administration, U.S. Department of Labor, informing employees of the protections and obligations provided for in the Act, and that for assistance and information, including copies of the Act and of specific safety and health standards, employees should contact the employer or the nearest office of the Department of Labor. Such notice or notices shall be posted by the employer in each establishment in a conspicuous place or places where notices to employees are customarily posted. Each employer shall take steps to insure that such notices are not altered, defaced, or covered by other material.

The Secretary argues that the judge's action undermines the language of section 8(c)(1) of the Act, 29 U.S.C. §657(c)(1), which states in part:

> The Secretary shall also issue regulations requiring that employers, through posting of notices or other appropriate means, keep their employees informed of their protections and obligations under this chapter, including the provisions of applicable standards.

We agree with the Secretary. We are not free to relieve a party of a statutory obligation. Noncompliance with a regulation that implements a specific statutory requirement cannot properly be characterized as de minimis. See Lake Butler Apparel Co. v. Secretary of Labor, 519 F.2d 84 (5th Cir. 1975). Also, section 17(i) of the Act, 29 U.S.C. §666(h), states: "Any employer who violates any of the posting requirements, as prescribed under the provisions of this chapter, shall be assessed a civil penalty of up to $1,000 for each violation." (Emphasis added). Thus, a penalty is required for posting violations. See C & R Cabinet Co., 75 OSAHRC 61/D10, 3 BNA OSHC 1206, 1974-75 CCH OSHD ¶19,668 (No. 4049, 1975). Accordingly, the judge erred in affirming a violation of section 1903.2(a)(1) but characterizing it as de minimis.[2/]

We also find that the judge's decision concerning the posting citation does not contain an adequate statement of the reasons or basis for finding a violation. The judge cited testimony tending to prove the charge and testimony tending to disprove it, and did not state why he resolved the testimony

---

2/ Chairman Rowland does not join in this conclusion. Because the Commission is remanding this case for the judge to further consider whether Respondent violated the posting regulation at section 1903.2(a)(1), Chairman Rowland finds it unnecessary at this time to reach the issue raised by the Secretary regarding the appropriate characterization of posting violations.

in favor of the Secretary. A judge's decision must contain a statement of the reasons or basis for the decision. E.g., Syntron, Inc., 10 BNA OSHC 1848, 1982 CCH OSHD ¶26,145 (No. 81-1491, 1982).

Accordingly, we set aside that part of the judge's decision affirming a violation of section 1903.2(a)(1) as de minimis, and remand the case for further proceedings on that citation consistent with this decision.[3/]

IT IS SO ORDERED.

BY THE COMMISSION

Ray H. Darling, Jr.

DATED: SEP 10 1982

Ray H. Darling, Jr.
Executive Secretary

---

3/ No party has filed objections regarding any other aspect of the judge's decision and only the citation alleging a violation of section 1903.2(a)(1) is before the Commission on review.

## SECRETARY'S PETITION FOR DISCRETIONARY REVIEW

Complainant, the Secretary of Labor, being aggrieved by the Decision and Order of the Administrative Law Judge in the above matter, hereby submits this Petition for Discretionary Review pursuant to Section 2200.91 of the Rules of the Occupational Safety and Health Review Commission.

## STATEMENT OF PORTIONS OF THE JUDGE'S DECISION AND ORDER TO WHICH EXCEPTIONS ARE TAKEN

The Secretary takes exception to Judge Louis G. LaVecchia's order reducing citation No. 2 for a non-serious violation

of 29 CFR 1903.2(a)(1) [1/] to a de minimis violation of the standard. (J.D. 8).

STATEMENT OF REASONS FOR WHICH EXCEPTIONS ARE TAKEN

Judge LaVecchia's reduction of the characterization of respondent's posting violation from nonserious to de minimis is wholly inconsistent both with Commission precedent and with the express purposes of the Act. The Commission has classified as de minimis those violations having only a neglible relationship to employee safety and health. Clifford B. Hannay and Son, Inc. , No. 15983, 6 BNA OSHC 1335 (R.C. 1978); Alfred Austin Construction Co., No. 4809, 4 BNA OSHC 1166 (R.C. 1976). Where a de minimis violation is found, there is no requirement that the cited condition be adated. National Rolling Mills Co., No. 7987, 4 BNA OSHC 1719 (R.C. 1976) But Commission case law also makes clear that violations like that involved in the present case are not to be regarded as de minimis. In General Motors Corp. (Inland Division), No. 76-5033, 8 BNA OSHC 2036 (R.C. 1980), the Commission held that a violation of the Act's reporting requirements could not be classified as a de minimis violation, stating;

1/ 29 CFR 1903.2(a)(1) states:

> (a)(1) Each employer shall post and keep posted a notice or notices, to be furnished by the Occupational Safety and Health Administration, U.S. Department of Labor, informing employees of the protections and obligations provided for in the Act, and that for assistance and information, including copies of the Act and of specific safety and health standards, employees should contact the employer or the nearest office of the Department of Labor. Such notice or notices shall be posted by the employer in each establishment in a conspicuous place or places where notices to employees are customarily posted. Each employer shall take steps to insure that such notices are not altered, defaced, or covered by other material.

> "Violations have been classified as de minimis when the Commission has found that the violations were so "trifling" that the entry of an abatement order or the assessment of a penalty was inappropriate. However, this decision demonstrates that the Commission does not consider the reporting requirements of the Act to be a trifling matter. Those requirements are the cornerstone of the Act and play a crucial role in providing the information necessary to make workplaces safer and healthier."

Similarly, the failure to post a notice informing employees of their statutory rights cannot be justifiably classified as de minimis. Judge La Vecchia's reduction of the non-serious violation totally undermines the language of Section 8(c)(1) of the Act which states in part;

> "...the Secretary shall also issue regulations requiring that employers, through the posting of notices or other appropriate means, keep their employees informed of their protections and obligations under this Act, including the provisions of applicable standards." 29 U.S.C. §657

A violation of this express statutory mandate can hardly be deemed so "trifling" as to negate the entry of an abatement order. General Motors Corp., supra. The notice informs employees that the Act exists and applies to them and their working conditions. Such dissemination of information was deemed by Congress to be essential to the effective enforcement of the Act. Lake Butler Apparel Co. v. Secretary of Labor, 519 F. 2d 84 (5th Cir. 1975); C & R Cabinet Co., Nos. 4049 and 3736, 3 BNA OSHC 1206 (R.C. 1975). The Commission itself has affirmed a citaiton for non-serious violations of 29 CFR 1903.2(a)(1) where an employer failed to display an OSHA poster. C & R Cabinet Co. supra ; See also, Cyclone Drilling and Workover, Inc., Nos. 80-1636 and 80-1721, 9 BNA OSHC 1439

(ALJ 1981); Eckel Manufacturing Co., No. 80-71405, 9 BNA 2145 (ALJ 1981); Weber Construction Co., No. 80-4107, 9 BNA OSHC 1958 (ALJ 1981).

In conclusion, although Judge La Vecchia correctly held that Respondent violated 29 CFR 1903.2(a)(1), he erred in classifying the violation as de minimis, thus not ordering abatement with the full terms of the standard. Therefore, it is respectfully requrested that the Commission direct review of the instant case.

DECISION AND ORDER

Appearances:

U. Sidney Cornelius, Jr., Esquire,
for the Complainant.

George R. Carlton, Jr., Esquire,
for the Respondent.

This is a proceeding under section 10(c) of the Occupational Safety and Health Act of 1970.

The respondent was issued two citations for alleged violations of sections 5(a)(1) and 5(a)(2) of the Act. It contested the citations, and the matter went to hearing on January 26, 1982 at Houston, Texas. A stipulation to jurisdiction and coverage under the Act was entered on the record. (Tr. 3).

In Citation No. 1, characterized as "serious," the respondent allegedly violated section 5(a)(1) of the Act by not furnishing employment and a place of employment which were free from recognized hazards that were causing or likely to cause death or serious physical harm to employees in that:

> Item 1(a) "Employees were exposed to potential hazard of a blowout and/or related fire in that no emergency means of escape was provided from the derrick platform (monkey board). Protection could have been provided by installation of a properly rigged and equipped escape line (geronimo).
>
> Item 2(a) "Employer failed to protect his employees from being struck by rolling and/or falling heavy drill pipe and drill collars on the pipe rack. Employer could have abated this hazard by using substantial wood wedges or by tying end item on each layer.

Proposed penalties of $300 and $240 respectively were issued.

In Citation No. 2, characterized as "other," the respondent allegedly violated the safety standard set forth at 29 CFR 1903.2(a)(1) by failing to post the OSHA notice informing employees of the protections and obligations provided for in the Act. No penalty was proposed for this alleged violation.

Upon motion filed well before the hearing the complainant was permitted to amend Items 1 and 2 of Citation No. 1 to allege violations of (1) the safety standard set forth at 29 CFR 1910.36(b)(1) in that

> "Building(s) or structure(s) designed for human occupancy were not provided with exits sufficient to permit the prompt escape of occupants in case of fire or other emergency:
>
> [Describing essentially the same hazard, etc., ]

and (2) the safety standard set forth at 29 CFR 1910.176(b) in that

> "Materials stored in tiers were not stacked, blocked, interlocked or limited in height so that they were stable or secure against sliding and collapse:
>
> [Describing essentially the same hazards, etc.,]

The proposed penalties were amended to $400 for each of the two violations alleged.

## The Relevant Testimony

Mr. Roy Moore, compliance officer for the Department of Labor, conducted a general schedule inspection of a worksite at which the respondent was completing the drilling of an oil well on July 2, 1981. Six of respondent's employees were engaged in the operation at that time. (Tr. 6). During the course of his inspection he noted an employee working on the "monkey board," which in oil field parlance refers to a work platform located at some height on the derrick. He stated that the employee was working at an 85-foot height above the derrick floor. (Tr. 8). He looked for an escape device other than the ladder built into the legs of the derrick, but found none. The tool pusher, Mr. Labow, confirmed that there was no alternate escape device. (Tr. 8). A definite hazard was envisaged in the absence of the alternative escape device, in view of the possibility of a "blowout" resulting in flying debris, and the fire which often accompanies a blowout. (Tr. 9). Blowouts do not occur frequently, however. (Tr. 9). Exhibits C-1 through C-3 are photographs of the derrick, showing the absence of the "Geronimo" line. The line is normally attached to the derrick slightly above the work platform. The line extends to a point well away from the derrick structure, and

a mechanical slide device permits a man, using a brake, to descend down and away from any danger presented on the derrick. (Tr. 13,14).

Also discovered by the compliance officer was a stack of 4-1/2 inch drill pipe stored on a rack which the witness felt did not comply with the safety standard covering such stacking of pipes. He believed a hazard was presented to employees by the possibility that the pipes might roll or fall off the rack onto the employees. (Tr. 15) The type and size of the pipe used normally has a weight of 16 pounds per foot. The 30-foot sections seen by the witness weighed close to 500 pounds each. ((Tr. 15). (Exhibits C-4,5). Small stones were observed between some of the pipe sections, and pieces of wood were also used for that purpose. (Tr. 18). The respondent's safety and health program appeared to be better than average for companies engaged in similar operations. (Tr. 19). An OSHA notice was not found at the site. (Tr. 20).

The drilling operation was being done in the oil field known as the "Austin Chalk." Blowout preventers were in place on the rig, these being devices that are placed over the well bore so that it can be rammed shut in the event such action becomes desirable. (Tr. 25). The ladder climbing device contains a counterweight for balancing the weight of an employee using the ladder. (Tr. 26). If the employee should let go of the ladder he would descend to the ground, counterbalanced in a manner to prevent his striking the ground very hard. (Tr. 26). The type of drilling rig in use here can be dismantled and moved to another location as the occasion demands. (Tr. 29). It is not the outdated type of drilling rig that remains a more or less permanent structure during use. (Tr. 30).

A blowout is not considered an explosion. It is the sudden release from a well of fluids, gas, drilling mud, and possibly pieces of equipment under heavy gas pressure. (Tr. 30,31). The witness believed the potential for the need to be able to escape quickly was present at the worksite. (Tr. 31). This type of drilling rig was not of the portable types of rigs mounted on truckbeds and used in well servicing operations. (Tr. 31).

The drilling had reached the 7,950 foot depth, with about 100 feet remaining to arrive at the completion depth. The likelihood of a blowout is much greater in the producing zone than elsewhere. (Tr. 33). Both oil and gas are derived from the Austin Chalk field. Gas is the driving force behind blowouts. (Tr. 33).

Mr. Steve Richards, part owner and general manager of the respondent, testified that he has a degree in petroleum engineering and has been active in oil field work all of his working life. He has performed practically all of the jobs involved in oil field operations. (Tr. 36). He stated that the Austin Chalk field is a "fractured" formation, requiring the fracturing of the site of the oil in order to permit it to flow. He considered the field an unlikely spot for a blowout. (Tr. 37). Company sponsored safety meetings are held with employees, and a bi-monthly inspection is generally made of its rigs by its insurance company. The "Geronimo" line is one of the items inspected. So are pipe racks. (Tr. 37). He inquired about the line on the cited rig and was told by the employees that the line was up but the T-bar was not put up because the brake was not working. It is company policy to have all safety devices in place during operations. (Tr. 38).

This was Labow's first or second day on the job as tool pusher. He had been promoted to the position about 6 weeks previously, but had entered the hospital for surgery at that time. He returned to work a couple of days before the inspection. (Tr. 38,39).

The witness felt that an employee in danger could attach himself to the climbing line and lower himself to the ground, using the counterweight as a damping factor. (Tr. 39).

He stated that the company had never had any drill pipe shift and fall from a rack. He pointed out that the cited pipe (Ex. C-4) is tied on the bottom layer, and that the method of stacking the pipe makes it self-chocking. The design of the tool joints results in a V-effect that each joint makes with another, restricting the movement of the pipe. (Tr. 41). The insurance company has never complained about this manner of stacking drill pipe. (Tr. 42). OSHA posters were bought at least twice for every rig used by the company. As far as the witness knew they were posted at the time of the inspection. (Tr. 42).

## Discussion

The safety standard set forth at 29 CFR 1910.36(b)(1) provides:

> "Every building or structure, new or old, designed for human occupancy shall be provided with exits sufficient to permit the prompt escape of occupants in case of fire or other emergency. The design of exits and other safeguards shall be such that reliance for safety to life in case of fire or other emergency will not depend solely on any single safeguard; additional safeguards shall be provided for life safety in case any single safeguard is ineffective due to some human or mechanical failure."

At 29 CFR 1910.36(a) covering applicability of the standard, exits from vehicles, vessels, or other mobile structures are excluded.

The respondent, on brief, argues that (1) the cited standard does not apply to this operation because the cited drilling rig is a mobile structure, and (2) even if applicable, no violation has been proved. The Secretary argues to the contrary in his brief.

The respondent cites two cases which became final orders of the Commission because they were not directed for review. These were Parker Well Service, 5 OSHC 1847 (1977) and Fairbanks Well Service, 5 OSHC 1873 (1977). These cases held the "means of egress" sub-part of the standard inapplicable to well-servicing units (truck-mounted derricks used to drill shallow wells and service existing wells) because they were self-propelled "mobile structures," within the meaning of 36(a) above. The respondent argues that although the drilling unit here considered was not mounted on a truck it should be classified as a mobile structure because it is a movable structure (generally disassembled and reassembled at some other point).

The Secretary cites Wilson Drilling Co. v. Marshall, 8 OSHC 1921 (1980), 624 F.2d 38 (1980) in which the Fifth Circuit Court of Appeals affirmed the application of 36(b) to the type of drilling rig here under consideration. The Court noted that no escape route accessible from the monkey board would allow descent other than straight down, whereas the Geronimo line, by providing a method of egress at an angle away from the derrick, provided a safe means of escape in the event of

a fire or explosion resulting from drilling. Essentially the same situation existed in the case at bar--the only means of escape were the ladder down to the derrick floor or the counterbalanced climbing line which would also lower an employee straight down to the derrick floor. The respondent's contentions with respect to the mobility of the drill rig must be rejected. This type of drill rig is movable, but that is not enough, in my opinion, to bring it within the exclusion as a "mobile" structure. I conclude that there was a violation of the standard at 29 CFR 1910.36(b)(1). The violation being "serious," within the meaning of the Act, the question is whether the proposed penalty of $400 is appropriate. Consideration of the elements in section 17(j) of the Act leads me to conclude that a penalty of $200 should be assessed.

As to the stacking of the drill pipe, the Secretary has, in my opinion, failed to demonstrate by a preponderance of the evidence that there was a violation of the applicable standard. The respondent's chief witness demonstrated substantial knowledge of oil field operations and stated that the self-chocking action of the pipe due to the shape of the tool joints made any shifting or falling of pipe very unlikely. He had never known, in his many years of experience, drill pipes to fall from the type of rack used. I would credit this witness's experience and credibility and find no violation of the standard.

The absence of the OSHA notice will be affirmed as a de minimis violation.

## Conclusions

1. The respondent violated the safety standards at 29 CFR 1910.36(b)(1) and 29 CFR 1903.2(a)(1).

2. The respondent did not violate the standard set forth at 29 CFR 1910.176(b).

## ORDER

1. Item 1 of Citation No. 1 is affirmed as a serious violation, with a civil penalty of $200 assessed.

2. Item 2 of Citation No. 1 is vacated.

3. Item 1 of Citation No. 2 is affirmed as a de minimis violation.

# OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

NOTICE OF DECISION

Secretary of Labor v. TRANSCONTINENTAL DRILLING CO., INC., (CIRCLE T DIVISION) & TRANSCONTINENTAL OIL CORPORATION

OSHRC Docket Nos. 79-2667 & 80-1482 and 80-6928 & 81-0041, Consolidated

1. Enclosed is a copy of my decision. It will be filed with the Commission on October 25, 1982, and will become the final order of the Commission on November 24, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is November 24, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

APPEARANCES:

Office of the Solicitor
U. S. Department of Labor
On behalf of Complainant, by
Jerry R. Atencio, Esquire
Of Denver, Colorado.

Kleh, Himelspach, Berrett, & Will
Of Denver, Colorado,
On behalf of Respondent, by
David M. Berrett, Esquire.

DECISION AND ORDER

Quentin P. McColgin, Administrative Law Judge:

This is a proceeding under §10(c) of the Occupational Safety and Health Act of 1970 (the Act), 29 U.S.C. §659c, involving alleged violations of §5(a)(2) of the Act, 29 U.S.C. §654(a)(2).*/ The central issue to be resolved in each of the four cases consolidated herein is whether respondents' failure to guard the kelly bushing and rotary table located on the floor of four different drilling rigs operated by respondents violated the general machine-guarding standard codified at 29 C.F.R.§1910.212(a)(1). The jurisdictional issues are admitted in the pleadings.

*/ "Each employer--shall comply with each of the occupational safety and health standards promulgated under this [Act]."

OSHA - Occupational Safety and Health Administration

R - Respondent's Exhibit

Z - Exhibit filed with July 10, 1981, stipulation in Docket No. 80-6928

## Background

These consolidated cases involve two different respondents. One of these is Transcontinental Drilling Company, Inc., the named respondent in Docket Nos. 79-2667 and 80-1482.*/ The other is Transcontinental Oil Corporation, the named respondent in Docket Nos. 80-6928 and 81-0041. Transcontinental Drilling Company, Inc., is a subsidiary of Transcontinental Oil Corporation. (Tr. 87) The former operates five divisions, including the Circle T Division, that are engaged in drilling operations. (Tr. 87)

At the request of the parties, the cases identified as Docket Nos. 79-2667 and 80-1482 were reassigned to the undersigned. The purpose

*/ Initially, the respondent in these two cases was identified as Circle T Drilling Company, Inc. It was stipulated at the hearing that the correct name of respondent was Transcontinental Drilling Company, Inc. (Circle T Division), and the style of the case was amended to reflect respondent's correct name. (Tr. 6, 7)

of this reassignment was to facilitate the admission into evidence in these two cases, testimony heard by the undersigned in other cases involving the same issue. Thereafter, these two cases were consolidated and a hearing was held in Denver, Colorado, on March 31, 1981.

Prior to the hearing, partial settlement proposals were filed in both Docket Nos. 79-2667 and 80-1482 which disposed of all the contested issues except for the alleged violation of the machine guarding standard. In the partial settlement proposal filed in Docket No. 79-2667, complainant moves to amend Citation No. 1 by changing the characterization of the violation alleged therein from a willful violation to a serious violation and by reducing the proposed penalty to $1,000.00. Respondent, in turn, moves to withdraw its notice of contest as to Citation No. 1, thereby leaving Citation No. 2, Item No. 1, as the sole contested issue in that case. */ In the partial settlement proposal filed in Docket No. 80-1482, complainant moves to amend Citation Nos. 4 and 5 by reducing the proposed penalties in all of the items contained in such citations except Citation No. 5, Item No. 5 (the alleged machine-guarding violation). Respondent, in turn, moves to withdraw its notice of contest to all the items of Citations Nos. 4, 5 and 6 except Citation No, 5, Item No. 5.

It appears that both settlement proposals comply with the applicable procedural requirements of 29 C.F.R. §2200.100(b) and that such proposals were duly posted for the benefit of the affected employees, none of whom were represented by an authorized employee representative. Inasmuch as no comments have been received with respect to such proposals, and it

*/ Respondent indicates in its answer that it did not intend to contest the non-serious citation (Citation No. 3, containing three items). Thus, the violations alleged in Citation No. 3 are deemed to have become final Commission orders fifteen days after the issuance of such citation in accordance with the provisions of 29 U.S.C. §659(a).

further appearing that the proposals are consistent with the provisions and objectives of the Act, such proposals are hereby approved. The citations are hereby amended in accordance with the terms of the proposals and, with the exception of Citation No. 2, Item No. 1, in Docket No. 79-2667 and Citation No. 5, Item No. 5, in Docket No. 80-1482, respondent's notice of contest filed in each case is dismissed.*/

No appearance was entered at the hearing on behalf of any of the affected employees. (Tr. 2/3) At the outset of the hearing, complainant moved to amend Citation No. 2, Item No. 1, in Docket No. 79-2667, so that it is the same as is set out in Citation No. 5, Item No. 5, in Docket No. 80-1482. (Tr. 6) This unopposed motion was granted. (Tr. 6)

Additionally, certain stipulations were entered into by the parties. It was stipulated that the use of Varco kelly bushing guards on the two rigs in question would not make the operation physically impossible, and that a Varco kelly bushing guard would fit on these particular bushings. (Tr. 14) It was further stipulated that the transcripts of testimony of four witnesses who testified in Exeter Drilling Northern, Inc., Docket Nos. 80-0496 & 80-1483 (Exeter) would be admitted into evidence in this proceeding as Commission Exhibits 1-3. (Tr. 17) It was also further stipulated that the exhibits pertaining to the kelly bushing issue, which were referred to by these witnesses in their testimony in the Exeter case, would be considered as exhibits in this proceeding. (Tr. 17) It was further stipulated that the transcripts of portions of the testimony of Mr. Philip Blake, elicited at the January 11, 1980, hearing in Brinkerhoff-Signal, 80 OSAHRC 63/A2 (No. 79-2589, 1980) in which the undersigned did not preside, would be received in evidence in this

*/ The orders issued herein affirm the violations and penalties as amended.

proceeding as Exhibit B-6.*/ (Tr. 18)

Finally, it was stipulated that the transcript of Mr. Hershstead, elicited at the hearing in R. L. Manning Company, Docket No. 80-2827, pertaining to the hazards of working around kelly bushings, would be received in evidence.**/ (Tr. 21)

Before the March 31, 1981, hearing in Docket Nos. 79-2667 and 80-1482, the two other cases consolidated herein were assigned to the undersigned, and scheduled for hearing.***/ Thereafter, the parties jointly moved for the cancellation of such hearing, based upon representations that they had agreed to certain evidentiary stipulations which would obviate the need for hearings. Accordingly, the scheduled hearings were cancelled.****/

---

*/ This testimony is offered for impeachment purposes. Based upon the testimony of Mr. Blake, which is summarized at pp. 14-17 of complainant's brief, complainant contends that Mr. Blake's testimony is incredible and should be given no weight. (complainant's brief at 22)

After reviewing complainant's arguments in support of this contention, together with the testimony cited, it is found that the matters raised are insufficient to serve as a basis for a determination that Mr. Blake's testimony was incredible--particularly since Mr. Blake was not afforded an opportunity to explain or deny any apparent inconsistencies in this testimony given in the two different proceedings.

**/ This transcript, identified as Commission Exhibit B-20, together with a written stipulation dated July 2, 1981, was subsequently filed in this proceeding. The stipulation indicates the specific portions of the transcript which the parties stipulate as being in evidence in this proceeding.

***/ In its answer filed in Docket No. 80-6928, respondent indicates its willingness to have its notice of contest withdrawn as to the non-serious citation issued in that case (Citation No. 2, Items No. 1 and 2). Treating this as a motion to withdraw its notice of contest as to such citation, such motion is hereby granted.

****/ The July 10, 1982, order cancelling the hearing stated in part:

> The parties have jointly moved to cancel the hearing in this matter. The parties represent that they have entered into a stipulation as to the evidence they would offer at the hearing. Additionally, they propose to jointly move that this case

(Footnote continued on following page.)

Thereafter, the parties filed stipulations in Docket Nos. 80-6928 and 81-0041 accompanied by two motions to consolidate filed by counsel for respondent. The first motion sought to consolidate Docket No. 80-6928 with 81-0041. In the second motion to consolidate, it is requested that the two cases in which Transcontinental Oil Corporation is the respondent be consolidated with the two cases in which Transcontinental Drilling Company, Inc. (Circle T Division) is the respondent. Both motions, which were unopposed, were granted, and the records in the two cases in which Transcontinental Oil Corporation is the respondent were closed without evidentiary hearings.

Pursuant to the stipulations entered into by the parties, the following undisputed facts were made a part of the record in the two proceedings in which Transcontinental Drilling Corporation is the respondent:

> On October 28, 1980, and December 5, 1980, an authorized representative of OSHA conducted lawful inspections of respondent's drilling rigs Nos. 38 and 39, respectively.
>
> The drilling rigs were located in North Dakota.
>
> Respondent employs approximately five employees per shift, known as "tower" in the industry, three shifts per day, to operate each drill rig, including a driller, tool pusher, derrickman, and two floor hands.
>
> Each of the aforesaid drill rigs were equipped with a Varco hex drive 27 1/2" kelly bushing.

---

****/ Continued.

> be consolidated with another case that has already been heard by the undersigned. This action, unless disallowed . . . is likely to obviate the need for an evidentiary hearing.
>
> It is further ordered that any affected employee or representative thereof who wishes to participate in this proceeding file within ten days his or her notice of appearance. Consideration of a motion to consolidate shall be held in abeyance in order to give affected employees an opportunity to participate.

Respondent did not provide a kelly bushing guard for the aforesaid kelly bushings at any time material hereto.

The drilling speed of the kelly bushing and the rotating parts of the rotary table given by respondent's driller at the rig was fifty-five revolutions per minute.

The work practices of employees of respondent's rig Nos. 38 and 39 were similar to the work practices at any of the other drill rigs, including respondent's drill rigs which were the subject of litigation in OSHRC Docket Nos. 79-2667 and 80-1482 (Consolidated)

The exposure of respondent's employees working on rigs Nos. 38 and 39 to the unguarded kelly bushing and rotating parts of the rotary table is similar to respondent's other drill rigs, including those that are the subject of litigation in OSHRC Docket Nos. 79-2667 and 80-1482 (Consolidated)

Guarding the rotating kelly bushing and rotating parts of the rotary table during drilling operation is not physically impossible, and the guard manufactured by Varco is capable of guarding the aforementioned equipment.

Additionally, the following stipulations, unique to each case, were entered into:

Docket No. 80-6928:

Exhibit Z-1 fairly and accurately depicts the red Varco kelly bushing in the center of the photograph, and the conditions of the drill rig floor as they existed at the time of the investigation.

The parties stipulate that Exhibit Z-1 may be introduced into evidence in this matter.

Docket No. 81-0041:

Exhibit A-1 fairly and accurately depicts the yellow Varco kelly bushing in the center of the photograph and the conditions of the drill rig floor as they existed at the time of the investigation.

Exhibit A-2 fairly and accurately depicts the yellow Varco kelly bushing in the center of the photograph, the mousehole with drill stem to the right of the kelly bushing, and the conditions of the drill rig floor as they existed at the time of the investigation.

The parties stipulate that Exhibits A-1 and A-2 may be introduced into evidence in this matter.

At the conclusion of the March 31, 1981, hearing, the parties waived closing argument, indicating their intention to file briefs in support of their respective positions. (Tr. 133) Thereafter, both parties submitted briefs. Additionally, respondent filed proposed findings of fact, conclusions of law, and order.

Having, with one exception, heard and observed the witnesses*/ and having considered the testimony and other evidence, together with the pleadings and arguments presented in this matter, the undersigned hereby issues the findings, conclusions, and orders set forth in this decision. To the extent that proposed findings of fact or conclusions of law have not been adopted in this decision, they are rejected as being either inaccurate or unnecessary for the disposition of the issues in these consolidated cases.

## Discussion

The undersigned has previously heard and decided two cases involving the same issue as is presented here, namely whether the failure to guard a rotating kelly bushing and rotary table violates 29 C.F.R. §1910.212(a)(1), which provides:

> Types of guarding. One or more methods of machine guarding shall be provided to protect the operator and other employees in the machine area from hazards such as those created by point of operation, ingoing nip points, rotating parts, flying chips and sparks. Examples of guarding methods are--barrier guards, two-hand tripping devices, electronic safety devices, etc.

In both R. L. Manning Company, _____ OSAHRC _____, (No. 80-2827, issued May 6, 1982) and Exeter Drilling Northern, Inc., _____ OSAHRC _____, (Nos. 80-0496 & 80-1483, issued April 19, 1982) (Manning & Exeter, respectively) alleged violations of the standard were not affirmed

*/ As previously noted, the undersigned did not hear the testimony of Mr. Philip Blake, which was elicited at the hearing in the Brinkerhoff matter, which testimony was included in this record pursuant to a stipulation by the parties.

based upon findings that the standard was unconstitutionally vague as applied to the rotating parts of respondent's drilling rigs; that complainant was estopped from asserting the standard in light of previous actions by OSHA's representatives which were construed as limiting the applicability of the standard so as to exclude from its coverage rotating kelly bushings that were "smooth" as well as the exposed portions of rotating rotary tables; and that respondents established the affirmative defense of greater hazard. Essentially the same arguments are advanced in support of and in opposition to the charges in these consolidated cases as were advanced in Exeter and Manning. Furthermore, the evidence in this record which goes to respondent's vagueness and estoppel arguments is essentially the same here as was presented in the two previously decided cases. Thus, for essentially the same reasons that it was found in Exeter and Manning, that the standard could not and should not be applied, it is so found here.

Before discussing the determination that the citations cannot be affirmed, consideration to the elements of the violation which have been established and the arguments raised by respondent going to the applicability of the standard which are rejected will first be considered.*/ Preceding this is a brief description of the physical characteristics of the machinery relevant to the issues presented here.

The kelly bushing and the rotary table are two of the three principal rotating parts that are situated in the center of the floor of an oil rig. The function of these parts is to convert the power derived from the engines into a rotating force which causes the drill stem to rotate.

*/ Because of the manifest unity of interest between the two named respondents here, they will be considered a single entity in this decision.

The drill stem begins at the top with a swivel which is hooked to the lower portion of the hoisting mechanism of a rig called the traveling block. Below the swivel is the third principal rotating part, called the kelly, which is a three-, four-, or six-sided piece of pipe, usually about 40 feet long. The kelly is attached to lengths of drill pipe or drill collars, lengths of which are connected together to form the vast bulk of the drill stem. Below the lowest length of drill pipe is the drill bit, which actually operates to dig the hole in a rotating motion.

The rotary table consists of a number of different parts. The top surface of the rotary table is approximately the same level as the drill floor. Most of the rotary table is covered, however, a portion is not. The kelly bushing is located on top of and in the center of the rotary table when it is in a drilling mode. It mates with the master bushing, which is a part of the rotary table. The kelly fits into a vertical opening in the center of both the kelly bushing and the rotary table. The rotary table transforms power into a rotational force. As it rotates, the kelly bushing rotates. Since the sides of the opening in the kelly bushing are flush with the sides of the kelly, the latter rotates as well. This rotational force, coupled with the weight created by the drill stem or the traveling block, is the means by which a hole is dug into the ground.

The kelly bushings used in each of the four drill rigs involved here were 27 1/2" Varco bushings. A number of photographs taken at different angles and distances of the four kelly bushings involved here permit a more detailed description of these bushings than was permitted in the two previously decided cases.*/ In observing these photographs,

*/ These photographs are identified by rig as:
Rig (undesignated) Docket No. 79-2667): B-1, B-2, B-3, B-4 & B-5
Rig No. 16 (Docket No. 80-1482): B-8, B-9, B-10 & B-11
Rig No. 38 (Docket No. 80-6928): Z-1
Rig No. 39 (Docket No. 81-0041): A-1 & A-2

it is noted that there are no significant differences in their general appearance. The bushing rests on a square base which appears to be approximately two inches high. (e.g., B-8 & B-9) The sides of the bushing are generally rounded, with large openings above the four corners of the bushing's base. The top of the kelly bushing is generally flat, with a slightly hemispherical shape. Both the top and the sides of the bushing contain numerous indentations. In some of these indentations are nuts and bolts, which are positioned so that they do not protrude from the plane of the surface.

There appear to be two types of protruberances in the kelly bushing. The first are the four corners of the base. The second are the "S" rollers which appear in two of the four openings located on the sides of the kelly bushing.*/ While no measurements were taken as to the extent to which the "S" rollers protrude from the plane of the surface of the sides of the kelly bushing, it appears that this protrusion is not significant.**/ Except for the nuts and bolts that are located in the recessed areas, it appears that all the edges of the different parts of the kelly bushing have been rounded, to virtually eliminate the possibility of lacerations, were someone to come into contact with the bushing while it was rotating. Furthermore, the only significant protrusion on the bushing is represented by the corners of the base. Since it is adjacent to the exposed portion of the rotary table which rotates with the bushing, such protrusion does not present a significant hazard unto itself.

Measurements taken of one of the bushings indicate that it is 12 inches high and 24 inches in diameter. (B-12) Furthermore, the

*/ The two other openings contain flat rollers which do not protrude from the plane of the surface of the side of the kelly bushing.
**/ This conclusion is based upon an examination of Exhibit A-1, which best depicts the protrusion. There, it is observed that the protrusion of the "S" roller is significantly less than the height of the square base of the kelly bushing, which is estimated to be approximately two inches high.

portion of the rotary table which is exposed is shown by photographs in evidence to be sufficiently wide so that a person's foot could be placed on that portion of the rotary table which is exposed and rotating. (A-2, B-4 & B-11)

In this case, as in the two previously decided cases, three of the four elements requisite to establishing a prima facie case are not in dispute. Kelly bushing guards were not provided on any of the four rigs involved here; hence, respondent did not comply with the standard. Further, respondent's employees had access to the non-complying conditions, in that its employees routinely walked within two to four feet of the rotating kelly bushings and rotary tables. Finally, respondent's managerial personnel had actual knowledge of the non-complying conditions. Thus, the only element which is disputed is whether the standard is applicable.

Respondent offers essentially four arguments in support of its position that the standard is inapplicable. First respondent argues that the cited standard applies only to machines used in manufacturing and not to oil drilling rigs. Here, respondent argues that the scope of the standard is limited to those machines which are or can be used in the production or manufacturing process. Since respondent is engaged exclusively in extracting raw materials (oil and gas) from the ground, it is argued that it is not engaged in the processes which are within the scope of the standard.

This argument is without merit. Oil is a raw material which is refined into a number of finished products, such as gasoline, and a variety of petrochemical products. Furthermore, both oil and gas are used as an energy source to produce or manufacture an infinite variety

of other products. Thus, in the broadest sense, the raw materials extracted by respondent are used in one form or another to manufacture or produce an infinite variety of products. The fact that respondent does not itself engage in producing a finished product is of no consequence. Indeed, if actual and direct involvement in producing a finished product were determinative, it would lead to the anomaly of one driller who was vertically integrated (from extracting the raw materials to refining them) being covered, whereas another driller, who was not so integrated, would not.

Respondent's second applicability argument is that the standard, being a general standard, is unenforceably vague unless it is interpreted as requiring a showing that the required protective measures were generally recognized by the particular industry as being clearly appropriate under the circumstances. Respondent bases this argument upon the several decisions of the Circuit Courts of Appeal which have imposed such a special burden upon complainant in cases involving other general standards, such as the personal protective equipment standard.*/ Respondent then argues that complainant failed to meet this burden; hence, a violation has not been established.

Despite the general scope of the standard, it is not so broadly worded as to superimpose upon complainant the burden of making the special showing which respondent suggests is required. Here, the specific protective measures which are required are spelled out with some degree of specificity. The standard requires "one or more methods

*/ This standard, 29 C.F.R. §1926.28(a) provides:

> The employer is responsible for requiring the wearing of appropriate personal protective equipment in all operations where there is an exposure to hazardous conditions or where this part indicates the need for using such equipment to reduce the hazard to the employees.

of machine-guarding." The standard further provides: "Examples of guarding methods are barrier guards, two-hand tripping devices, electronic safety devices, etc." Furthermore, the standard provides by illustration the types of hazards for which machine guarding is required. Thus, guarding is required "to protect. . . employees. . . from hazards such as those created by. . . rotating parts." Thus, the standard cannot be said to be so broadly worded as to superimpose upon complainant the burden of making the special showing of industry acceptance of specific protective measures.

Respondent's remaining challenges going to the applicability of the standard are that it is unconstitutionally vague when applied to its operations and the OSHA is estopped from applying the standard in view of OSHA's inconsistent enforcement policy vis-a-vis the guarding of kelly bushings. The record in this case establishes both defenses.

For the reasons discussed below, it is found that the standard gives insufficient warning to members of the oil drilling industry that it would be applied to require the use of kelly bushing guards. This determination is based upon the decision in Diebold, Inc. v. Marshall, 585 F.2d 1327 (6th Cir. 1978)(Diebold) wherein it was held that the point of operation guarding standard was impermissibly vague as applied to press brakes utilized by respondent there. In analyzing that decision, it appears that the court relied upon the presence of essentially three factors in its determination that the standard involved there was impermissibly vague. The first of these factors is essentially one of ambiguity created by the standard itself. The second is a demonstration of industry unawareness of the applicability of the standard and the

third is the confirmation of that practice by a pattern of administrative enforcement. Diebold, supra, 585 F.2d at 1336-37.

All three factors are present here. The ambiguity of the standard lies in its breadth and the absence of any definitional framework to guide employers as to what mechanisms are and are not subject to its coverage. In the abstract, an oil rig can be considered a "machine," with "rotating parts" (the kelly, the kelly bushing, and the rotary table). However, an oil rig is not generally considered to be a machine, and an employer within the oil drilling industry could reasonably interpret the standard as not applying to its operation.

Nothing better demonstrates this ambiguity than OSHA's initial failure to recognize the applicability of the standard to drilling operations. Thus, in the early cases wherein the failure to guard the kelly bushing and the rotary table were challenged, violations of standards other than the machine-guarding standard were alleged. DB Drilling Corporation, 78 OSAHRC 21/D2 (No. 76-4668, 1978); MND Drilling Corporation, 77 OSAHRC 183/C5 (No. 76-4149, 1977). Similarly, in the initial citation issued in one of the cases consolidated here (Docket No. 79-1667), a violation of another standard was alleged.*/

Industry unawareness of the applicability of the standard to drilling operations is manifested by the commercial practice prevalent in the industry of not guarding these rotating parts. The most quantifiable evidence on this issue (the prevalent industry practice of not guarding kelly bushings) was presented by the compliance officer in the Manning case, which evidence is stipulated as being a part of the record in this

*/ Citation No. 2, Item No. 1, issued April 24, 1979. This citation, which was amended May 1, 1979, to allege a violation of the machine-guarding standard, originally alleged a violation of 29 C.F.R. §1926.300(b)(2).

case. The compliance officer there testified that after conducting 100 inspections of oil rigs, he had never seen a kelly bushing guard in operation. (M Tr. 67) The other evidence on this point consists of the testimony of the compliance officer who inspected the rigs in Docket Nos. 79-2667 & 80-1482, and who testified that since 1976 he had seen "lots of kelly bushing guards" in use. (Tr. 69) This evidence, coupled with the dearth of reported cases wherein the failure to guard kelly bushings was successfully challenged, strongly indicates that the prevalent practice within the industry is not to guard such bushings.

Given this finding, and adopting the same rationale as was expressed in Diebold, wherein the Court rejected any inference that the absence of guarding in that industry was indicative of industry's disregard of a known legal requirement, it is concluded that the average employer within the oil drilling industry has been unaware that the regulations require the use of a kelly bushing guard.

The third and final factor present here is the pattern of administrative enforcement which operated to confirm industry practice. Through a variety of different actions by OSHA, its officials and the Commission itself, members of the oil drilling industry could reasonably infer that kelly bushing guards were not required.

Actions by OSHA and its officials which confirm such industry opinion consist of a number of inconsistent enforcement actions which, to the extent that they do not confuse the industry as to the applicability of the standard, confirm the prevalent industry practice of not guarding kelly bushings or rotary tables. The first of these actions concerns OSHA's uniform policy of not requiring the guarding of the kelly, which

is equally hazardous and accessible to oil rig workers. (E. Tr. 256) Inasmuch as the rationale for requiring the guarding of rotating parts is "anything that is rotating, a coupler or a shaft no matter how smooth it is, should be covered,"*/ OSHA's failure to require perimeter guarding around the kelly bushing and rotary table, which would also provide protection from the hazard associated with the rotating shaft of the kelly, is incomprehensible.

Additionally, OSHA has inconsistently enforced the standard in this industry. In what OSHA has designated as its Region 8, the standard is deemed to apply and is enforced. In area offices in other regions of the country, it is either not deemed to apply, or is not enforced as to "smooth" kelly bushings. (E. Tr. 481, 487, 496; Tr. 91, R-1)**/

Other evidence of OSHA's inconsistent enforcement policy is presented by the act of approving state enforcement plans which do not require kelly bushing guards. The record shows that the states of Utah, Michigan, Wyoming, California and Alaska all have approved safety programs for the drilling industry, none of which are enforced to require the guarding of kelly bushings. (E. Tr. 480) While OSHA is not directly responsible for the enforcement programs of the states, its act of approving the state plans can reasonably be interpreted as confirming the prevailing industry practice of not guarding kelly bushings and rotary tables, particularly in the instance of the regulations promulgated in the state of Wyoming, which contain express provision exempting kelly bushings from guarding requirements. (E. Tr. 480, R-1***/)

---

*/ E. Tr. 215, 275

**/ "Smooth" kelly bushings are defined by the industry as those bushings without protruding J-bolts. The latter type of bushing is now obsolete and not in general use. (E. Tr. 272) The Varco bushing, which is of the type involved here, is as smooth as any bushing available in the industry. (E. Tr. 439, M. Tr. 70)

***/ This document, R-1, which contains the Wyoming regulations, was admitted into evidence in Exeter. Pursuant to the stipulation entered into by the parties here, it is considered a part of the record in this case.

The most graphic evidence of OSHA's inconsistent enforcement policy is presented in the form of a memorandum dated June 19, 1979, from the Director, Federal Compliance and State Programs, to a regional administrator of OSHA. This memorandum provides:

> Kelly Bushings on oil drilling rigs that are smooth and do not present a potential hazard to employees that come in contact with the Bushings do not require guarding. However, Kelly Bushings with projections or indentations do present a potential hazard to employees who come into contact with the Bushings and shall be guarded or employer shall be appropriately cited. (R-6)*/

The most reasonable interpretation of this statement is that kelly bushings which do not have protruding J-bolts, such as the kelly bushings involved here, need not be guarded. In fact, persons associated with the oil drilling industry have so interpreted this statement. (E. Tr. 485-87)

Finally, the decisions of Commission judges which preceded the issuance of the citations sub judice contributed to the view that "smooth" kelly bushings need not be guarded. Research discloses ten judge's decisions that were issued prior to the issuance of the citations sub judice involving the failure to guard kelly bushings. Two of these were based upon alleged violations of standards other than the machine-guarding standard. Those citations were vacated based, in whole or in part, upon the inapplicability of such other standards. DB Drilling Corporation, supra; MND Drilling Corporation, supra, (also greater hazard). One case, Signal Oilfield Services, Inc., 78 OSAHRC 39/D1 (No. 77-0026, 1978), which involved the old style kelly bushing with protruding J-bolts, held that the failure to guard that kelly bushing violated the machine-guarding standard. Of the remaining seven decisions, four vacated citations alleging violations of the machine-guarding standard based

*/ This document was admitted into evidence in the Exeter case. By virtue of the stipulation by the parties it is also included in this record.

upon findings of greater hazard. Graywolf Drilling Company, 78 OSAHRC 94/A8 (No. 77-3803, 1978); Circle Bar Drilling Company, 78 OSAHRC 82/D4 (No. 77-3581, 1978); (also lack of employee exposure); Graywolf Drilling Company, 78 OSAHRC 70/F1, 1978); Hughes Drilling Company, Inc., 79 OSAHRC 58/A2 (Nos. 76-2945 & 76-3574, 1977).

All three of the remaining judge's decisions affirm the violation of the machine-guarding standard. Only one of these, Fred Wilson Drilling Company, Inc., 78 OSAHRC 67/D2 (No. 77-3578, 1978), was issued before the issuance of all four citations involved here. Indeed, months before the issuance of citations in Docket Nos. 80-6928 and 81-0041, such decision had been reversed, based upon a finding by the Fifth Circuit Court of Appeals of greater hazard. Fred Wilson Drilling Co., Inc. v. Marshall, 624 F.2d 38 (5th Cir. 1980) Thus, as to the two earliest citations issued to respondent (in Docket Nos. 79-2667 and 80-1482), only one of the five decisions that had been issued wherein the failure to guard kelly bushings was challenged as violating the general machine-guarding standard, was the government's position sustained. Furthermore, that single decision was under review and was subsequently reversed. The next decision was issued June 19, 1980, in the case entitled Brinkerhoff-Signal, Inc., 80 OSAHRC 63/A2 (No. 79-2589, 1980. Respondent clearly had notice of this decision before the inspection and ensuing citations that were issued in Docket Nos. 80-6928 & 81-0041.*/ The final judge's decision on this issue was issued in the case entitled Bomac Drilling Company & True Drilling Company, ____ OSAHRC _____ (Nos. 79-0828 & 78-5257, November 28, 1980) a month after the inspection in Docket

*/ The inspection in Docket No. 80-6928 took place October 28, 1980, and the citation was issued November 4, 1980. The inspection in Docket No. 81-0041 took place on December 5, 1980, and the citation was issued December 15, 1980.

No. 80-6928 and a few days before the inspection in Docket No. 81-0041. Thus, at the critical times in each of the cases consolidated herein, namely, at the time of the inspection wherein the alleged violative conditions were observed, a clear majority of the Commission decisions on point had failed to affirm violations of the machine-guarding standard.

The foregoing establishes a reasonable basis for members of the oil drilling industry believing that kelly bushings need not be guarded. There is, however, evidence in this record going to the subjective state of mind of respondent's representatives vis-a-vis the applicability of the standard to respondent's operations, which should also be considered. This evidence consists of the testimony of respondent's safety director, Mr. Cornelius, who testified that prior to the inspection which gave rise to the citations involved here, he was aware that OSHA representatives were citing employers for failure to use kelly bushing guards in Montana. (Tr. 122) Mr. Cornelius further testified that respondent has five divisions that are engaged in drilling operations in various parts of the country. (Tr. 86) As the corporate safety director for respondent, Mr. Cornelius communicated with various OSHA officials concerning OSHA's enforcement policies. While it was communicated to him by the area director in Billings, Montana, that kelly bushing guards were considered "needed" (i.e., required) in that area, other OSHA area offices located in the southern regions of the country did not consider such guards to be required. (Tr. 119-20) More specifically, Mr. Cornelius testified that a citation was issued to another division of respondent's operating in east Texas, which citation was deleted after an informal conference wherein Mr. Cornelius persuaded the area director in Tyler, Texas, that kelly bushing guards were not needed. (Tr. 91-92, R-1.)

Mr. Cornelius further testified that, except for the deleted citation emanating from the area director's office in Tyler, Texas, and the four issued to it in the states of Montana and North Dakota, none of respondent's rigs had ever been cited for failure to use kelly bushing guards. (Tr. 121)

While the foregoing indicates an awareness that respondent's rigs in North Dakota and Montana would be cited for failing to use kelly bushing guards, it does not demonstrate an awareness that such failure constituted a violation of the machine-guarding standard. To the contrary, the evidence shows that respondent's safety director was actually aware of the difference of opinion among OSHA's own officials. Since such officials could not themselves agree as to whether guarding was required, it would seem unreasonable to conclude that respondent's officials were any more omniscient than complainant's.

In view of the foregoing, it is found that the standard is unconstitutionally vague as applied to rotating kelly bushings and rotary tables. It is further found that the previously quoted statement by the Director, Federal Compliance and State Programs, constitutes an express statement by a responsible official of the enforcement authority indicating a conscious decision to restrict the application of the standard to types of kelly bushings other than the "smooth" types of kelly bushings which are involved here. This alone is a sufficient basis for determining that the standard is inapplicable to the so-called "smooth" type kelly bushings, even though, in the abstract, the standard may be applicable. See Seattle Crescent Container Services, 7 BNA OSHC 1895, 1979 CCH OSHD ¶24,002 (No. 15,242, 1979).

It is noted that subsequent to the closing of the record in these consolidated cases, OSHA has announced the initiation of an experimental

variance program for the oil and gas drilling industry. This program, which was announced June 8, 1982, (47 Fed. Reg. 24,874) grants to those industry members who are participating in the program a variance from the machine-guarding standard (29 C.F.R. §1910.212(a)(1)) in order to permit them to test an alternative method of protecting workers from the hazards associated with rotating kelly bushings that are "smooth" and exposed portions of the rotary tables on drilling rigs. Key features of this alternative program are: that a qualified person shall be designated who will control activity on the rig floor while the kelly bushing is rotating; that a person capable of stopping the rotating equipment must be at the controls when employee tasks require them to handle materials that might become entangled with the rotating parts; and that equipment, such as hoses and chains, which are capable of becoming entangled with such rotating parts, are not permitted to be any closer than a specified distance from such rotating parts.

The salient feature of the announcement of this program is the implicit rescission of all previous directives and enforcement programs which conflict with the interpretation explicit in the announcement--that the machine-guarding standard applies to the rotating parts on oil rigs. Had such announcement been made before the issuance of the citations involved here, it is doubtful that respondent's vagueness argument would have prevailed. Nevertheless, the record in this case does not indicate that the previous policy statements and enforcement policies which conflicted with OSHA's current interpretation of the standard were rescinded before the issuance of the citations involved here. Thus, during the critical periods, members of the drilling industry, including respondent, were faced with the previously described circumstances, the thrust of which created genuine confusion as to what they were required to do or not do under the standard.

Respondent has also raised the affirmative defenses of impossibility of compliance and greater hazard to the machine-guarding charge. In view of the finding made here, that the standard cannot be applied retroactively to respondent, it is not necessary to address these additional defenses.

## ORDER

In view of the foregoing, IT IS HEREBY ORDERED that:

In Docket No. 79-2669:

1. Citation No. 1, Item No. 1, is AFFIRMED, as a serious violation, and a penalty of $1,000.00 is ASSESSED.
2. Citation No. 2, Item No. 1, is VACATED.

In Docket No. 80-1482:

3. Citation No. 4, Item No. 1, is AFFIRMED, and a penalty of $315.00 is ASSESSED.
4. Citation No. 5, Item No. 1, is AFFIRMED, and a penalty of $315.00 is ASSESSED.
5. Citation No. 5, Item No. 2, is AFFIRMED, and a penalty of $315.00 is ASSESSED.
6. Citation No. 5, Item No. 3, is AFFIRMED, and a penalty of $315.00 is ASSESSED.
7. Citation No. 5, Item No. 4, is AFFIRMED, and a penalty of $280.00 is ASSESSED.
8. Citation No. 5, Item No. 5, is VACATED.
9. Citation No. 6, Item Nos. 1-6, are AFFIRMED, and no penalties are assessed.

In Docket No. 80-6928:

10. Citation No. 1, Item No. 1, is VACATED.

11. Citation No. 2, Item Nos. 1 & 2, are AFFIRMED, and no penalties are assessed.

In Docket No. 81-0041:

12. Citation No. 3, Item No. 1, is VACATED.

# OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

## NOTICE OF DECISION

Secretary of Labor v. Williams Enterprises, Inc.
OSHRC Docket No. 82-37

1. Enclosed is a copy of my decision. It will be filed with the Commission on October 25, 1982, and will become the final order of the Commission on November 24, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is November 24, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

Date: October 5, 1982

| v. | : | DOCKET NUMBER 82-37 |
| WILLIAMS ENTERPRISES, INC. | : | |
| Respondent | : | |

Appearances:

Kenneth A. Hellman, Esq. and
Orlando J. Pannochea, Esq.
U.S. Department of Labor
For the Complainant

James Brent Clarke, Jr., Esq.
For the Respondent

DECISION AND ORDER

Sommer, Judge

On November 4, 1981, Respondent was issued serious Citation No. 1 alleging violation of 29 C.F.R. 1926.302(b)(7)[1/] and a violation of 29 C.F.R. 1926.750(b)(1)(iii)[2/]. A penalty of $450 was proposed for Item No. 1 and $630 for Item No. 2 of the serious Citation No. 1.

---

1/ Section 1926.302 Power-operated hand tools provides:
(b) Pneumatic power tools. (7) All hoses exceeding 1/2-inch inside diameter shall have a safety device at the source of supply or branch line to reduce pressure in case of hose failure.

2/ Section 1926.750 Flooring requirements provides:
(b) Temporary flooring - Skeleton steel construction in tiered building.
(b) (1)(iii) Floor periphery - safety railing. A safety railing of 1/2-inch wire rope or equal shall be installed, approximately 42 inches high, around the periphery of all temporary-planked or temporary metal-decked floors of the buildings and other multi-floored structures during structural steel assembly.

A hearing was held in Washington, D.C. Both parties were represented by counsel who filed briefs at the conclusion of the case.

No jurisdictional facts are in dispute, the parties having pleaded sufficient facts to establish that the Respondent is subject to the Act and the Commission has jurisdiction of the parties and of the subject matter.

The general issue to be determined is whether the Respondent violated the safety regulations as alleged in the citation and, if so, what penalty, if any, is appropriate.

## Summary of the Evidence

Respondent corporation is in the business of construction contracting with its principal place of business being located in Merrifield, Virginia. It was engaged in erecting the steel for the building at the place of the alleged violations.

### Testimony on Behalf of Complainant

The worksite was inspected by James R. Sullivan, the Secretary's compliance officer. On October 29 and 30, 1981 (T. 9), a thirteen story building was in the process of being erected at 1333 H Street, Washington, D.C. There were six trades involved in the erection and the Respondent was doing the steel erection work (T. 16). The decking had been installed to the sixth floor of the building at the time of the October 29, 1981 inspection with temporary flooring down (T. 17). The compliance officer testified that he observed an individual, who was subsequently identified to him as a foreman for the Respondent, go to the edge of the building on five occasions while working on the sixth floor deck (to call down instructions to other employees), and that there was no half inch wire rope or railing on the building periphery for

fall protection, nor was he wearing a safety belt of any kind (T. 20, 21). The decking was considered temporary inasmuch as it was not fully fastened, and it was only temporary in that eventually a deck would be put in place to fully support the particular floor site (T. 22). Mr. Sullivan viewed the scene both from an adjoining building and when he was on the 6th floor of the building being constructed (T. 20, 24). Mr. Viner the general construction superintendant told Mr. Sullivan that the 6th floor where the Respondent's employee was seen near the building precipice is approximately 68-70 feet above the ground, and Mr. Sullivan stated that if he fell there was a probability of substantial bodily injury or death (T. 27). He was of the opinion that a wire railing or cable could have been installed along the periphery of the sixth floor (T. 29-30).

Testimony on Behalf of Respondent

Mr. Joseph Henry, the superintendant on the job for Respondent at the location where the citations were issued, testified they were erecting the steel for a thirteen story building (including a roof and penthouse) (T. 87). He identified an existing building as pictured in government exhibit #1 which showed a window on the seventh floor; he noted there was a window on the ninth floor which could be opened and which he used to call out to the people working down below (T. 90). Mr. Henry stated that when he came on the job he noticed the electric compressor had no safety valves, and that he called to have said valves put on (T. 91-2). The compressor was run an hour or two a day and was on the job site about a week before the inspection. The valves were installed by the second day of Mr. Sullivan's visit. The attorney for the Respondent stipulated that the safety valve was not on the compressor when it came on the job about a week before the inspection, and that it was intermittently used during this time (T. 94).

Alexander J. Czernowski the safety director of the Respondent corporation testified that they have a ongoing safety program consisting of monthly meetings, with speakers and films. He stated the majority of superintendents have safety talks every week, and that the company has invested "quite a bit of money in the last several years in this safety program." (T. 96-7).

## Discussion

Section 5(a)(2) of the Act provides that each employer ". . . shall comply with occupational safety and health standards promulgated under this Act." In order to prove a Section 5(a)(2) violation, the Secretary must demonstrate that a particular standard applies to the facts, that the cited employer failed to comply with the standard, and that the cited employer's employees had access to the hazard. Anning-Johnson Co., 76 OSAHRC 54/A2, 1193, 1197, 1975-6 CCH OSHD ¶ 20,690 (Nos. 3694 & 4409, 1976).

### Alleged Violation of 29 C.F.R. 1926.302(b)(7) - Item No. 1, Serious Citation Number 1

The Respondent admitted and the evidence shows that he had failed to provide the compressor involved herein with a safety device to reduce pressure in case of hose failure. Thusly, his employees were exposed to a hazard in case of hose failure. This practice clearly violated the regulation and citation is affirmed.

### Alleged Violation of 29 C.F.R. 1926.750(b)(1)(iii) - Item No. 2, Serious Citation No. 1

This item alleges a serious violation in that the Respondent failed to install the wire required by Section 1926.750(b)(7)(iii) around the periphery of a building it was working on in order to protect workers who were doing work on the opensided floor. At the time of inspection the building was still

in the steel erection stage and Respondent's employees were working on the sixth floor and a crew was erecting steel for the seventh floor. The evidence is clear that permanent flooring had not been completed on the sixth floor. Absent the perimeter protection along the edge of the 6th floor a violation of Section 1926.750(b)(1)(iii) is accordingly established. The evidence further demonstrates that the Respondent's foreman was observed working exposed to the unguarded floor perimeter. Accordingly, access to the hazard has been shown. Gilles & Cotting, Inc., 76 OSAHRC 30/D9, 3 BNA OSHC 2002, 1975-76 CCH OSHD ¶ 20,448 (No. 504, 1976).

The Respondent argues that the standard does not apply to temporary flooring which admittedly existed herein. There is no merit in this argument. The standard set forth in 29 C.F.R. Section 1926.750(b)(1)(iii) applies during the steel erection stage of construction before the installation of the permanent floor. The Ashton Co., Docket No. 5111, 3 BNA OSHC 1968, CCH OSHD ¶ 20,351 (Jan. 29, 1976). This item is therefore affirmed.

In assessing penalties we must conisder the size of the business of the cited employer, the gravity of the violations, the good faith of the employer and history of previous violations. 29 U.S.C. Section 661(i). While the gravity of the violations is high, the Respondent demonstrated good faith by expeditiously providing the safety valve for the compressor (on the second day of the inspection it was installed). The evidence also demonstrates the compressor was only in use without the safety valve for approximately five days, one or two hours daily, thus further reducing the hazard of injury. The record further shows that the Respondent is safety conscious, maintains an ongoing safety program and is fully aware of its safety responsibility which it imparts to its workforce. It shows a concern for employee safety,

and there is no history of previous violations. The number of employees exposed to the violative conditions is not fully developed by the record. Having considered the factors in Section 17(5) of the Act, 29 U.S.C. § 666(i), it is concluded that a penalty of $100 for Item No. 1 and $150 for Item No. 2, or a total penalty of $250 for serious Citation No. 1, is reasonable and appropriate under all the existing facts and circumstances.[3/]

## Findings of Fact

1. Respondent corporation is in the business of construction contracting, and was engaged in steel erection and other construction work on a building situated at 1333 H Street, Washington, D.C.

2. A compressor in use at the construction site was not provided with a safety device to reduce pressure in case of hose failure thereby exposing its employees to the hazard of a serious injury.

3. The outside perimeter of the sixth floor of the building under construction, which floor was not permanent and upon which an employee of the Respondent was working on, did not have a 1/2 inch wire rope or equal approximately 42 inches high installed around it, thereby exposing its employees to the hazards of a fatal or serious injury.

## Conclusions of Law

1. The Commission has jurisdiction over the case.

2. The Respondent has violated 29 U.S.C. § 654(a)(2) by failing to comply with 29 C.F.R. § 1926.302(b)(7) and 29 C.F.R. 1926.750(b)(1)(iii), as charged.

---

3/ All prepared briefs including findings and conclusions submitted by the parties have been considered, as have their contentions. To the extent such proposals and contentions are consistent with this decision, they are accepted.

3. Considering the criteria contained in 29 U.S.C. § 661(i) in conjunction with the entire record, a total penalty of $250 is considered appropriate.

## ORDER

Citation Number 1 is affirmed and a total penalty of $250 ($100 for Item No. 1, $150 for Item No. 2) is assessed.

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners

BY THE COMMISSION:

An ironworker fell to his death when the mast of a stiffleg derrick he was dismantling collapsed. The Secretary of Labor ("Secretary") issued a citation[1/] alleging that Respondent, State Moving-Trucking, Inc. ("State"), had violated section 5(a)(1) of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act").[2/] Administrative Law Judge Abraham Gold vacated the citation, concluding that State did not violate section 5(a)(1). Commissioners Cleary and Cottine directed this case for review under 29 U.S.C. § 661(i). For the reasons that follow, we reverse

---

1/ The citation, among other things, alleged: "ironworker dismantling stiffleg derrick, working high above pavement, was not provided with safe working surface, or equivalent protection."

2/ Section 5(a)(1) provides:

> Sec. 5(a) Each employer -- (1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or likely to cause death or serious physical harm to his employees.

Judge Gold's decision and conclude that State failed to comply with section 5(a)(1). We assess a penalty of $600.

I.

After submitting a bid of $1,500, State was awarded a contract by Bird & Son ("Bird") to dismantle a stiffleg derrick on Bird's property and to clean the surrounding area.[3/] This was only State's second job.[4/] The derrick was to be removed because it had not been used for 22 years and was rusting. Prior to commencement of the job, John Pompeii, president of State, was shown blueprints of the derrick by a representative of Bird.[5/]

In order to carry out the dismantling of the derrick, State rented a 30-ton crane from Gansett Crane Service. Along with the crane, Gansett supplied a crane operator and oiler. Before the work began, Pompeii asked Peter D'Ambruoso, president of Gansett, for suggestions regarding the dismantling of the derrick. D'Ambruoso testified that his reply was, "John, I know nothing about a derrick. There's not much I can suggest to you."

Pompeii also asked D'Ambruoso if he knew anyone available for work who could climb the derrick and cut the stifflegs with a torch. D'Ambruoso informed Pompeii that David Mandeville, an unemployed ironworker, had recently inquired about work. Using D'Ambruoso as an intermediary, State engaged Mandeville to cut the stifflegs for a fee of $75.

---

3/ A stiffleg derrick is a fixed derrick whose mast is capable of being rotated and is supported or held in place by two or more rigid members, called stifflegs. The term "stiffleg derrick" is defined in the standard at 29 C.F.R. § 1910.181(a)(9). See also American National Standard Institute (ANSI), Safety Code for Cranes, Derricks, Hoists, Jacks, and Slings, B30.6-1969, §§ 6-0.2.1.9 and 6-1.2.3a (1969).

4/ State had been incorporated approximately one and one-half months before the incident. The four officers of State, who were its only full-time employees, previously had worked in the rigging and moving business.

5/ These blueprints are not part of the record, nor was any evidence presented concerning the content of the blueprints.

After arriving at the Bird facility with Mandeville, Ralph Imperatore, the Gansett crane operator, went to Pompeii to find out what he wanted done. Pompeii indicated that the boom of the derrick was to be taken down first, and then the other sections were to be removed. The boom swung from a vertical member, called a mast, which was held in place by two stifflegs attached to the top of the mast. Pompeii also told Imperatore to support both stifflegs with the crane, but Imperatore replied that he would not use the crane to support two loads because of the danger of the crane tipping. Instead, he told Pompeii that he "would take [the derrick] down the way that [he] felt was best. . . ."

After the crane's guy wires were hooked to one stiffleg, Mandeville ascended to the top of the mast of the derrick, climbing the first 40 feet on a ladder and the remaining 22 feet on the mast webbing. According to Imperatore, Mandeville was supposed to stand near the top of the mast and cut part way through the stiffleg that was hooked to the crane. Mandeville then was to move onto that stiffleg in order to get into a better position to complete the cut.[6/]

Imperatore testified that it took Mandeville "quite a while" to cut the stiffleg. Pompeii testified that when Mandeville shouted that he had an inch to go, he (Pompeii) hollered "no, no." At that point the unsupported stiffleg and mast wobbled and then fell to the ground. Mandeville unsuccessfully tried to move over to the supported stiffleg, was jarred loose from the mast, and fell to the ground. At the time of the incident, Pompeii and the other three officers of State, who were assisting in the operation, were standing in the

---

6/ Pompeii testified that he did not realize that Mandeville had climbed the mast to cut the stiffleg, since Imperatore had instructed Mandeville to attach guy wires before cutting the stiffleg. Pompeii's testimony was unclear with respect to the purpose of the guy wires and where they were to be attached. Further, Imperatore stated that he did not instruct anyone to place guy wires.

vicinity of the derrick.[7/]

The mast of the derrick was connected to the ground by only a ball joint and, therefore, was without sufficient support when the stiffleg that was attached to the crane was cut away from the mast. According to Imperatore, neither Pompeii nor any other person associated with the job knew that the mast was not bolted or cemented in a fixed position at the base.[8/]

Martin Byrne, business agent for Local 237, Ironworkers' Union, testified that the method used to dismantle the stiffleg derrick was improper.[9/] According to Byrne, the correct method of dismantling a stiffleg derrick is to first place temporary guy wires on the mast to hold the mast in place, and then to remove the stiffleg.[10/]

II.

Judge Gold determined that Mandeville was not an employee but rather was an "independent contractor unprotected by section 5(a)(1) of the Act." However, the judge found that the four officers of state were State's employees for purposes of the Act and that the officers were exposed to the

---

7/ Pompeii was standing behind the crane. McWeeney, the treasurer, was at the foot block of the mast when it started to fall. Another officer was near the paper shed acting as a fire watch. The falling mast struck the roof of the paper shed. The fourth officer was working on a rig at the time of the incident.

8/ OSHA compliance officer John Koska testified that Pompeii told him that he (Pompeii) thought that the mast was bolted at the bottom and therefore would remain vertical after one stiffleg was cut away.

9/ The parties stipulated to Byrne's expertise and knowledge with respect to the ironworking industry. Also, State's counsel stated that Byrne was "eminently qualified" concerning setting up and dismantling cranes.

10/ Byrne also stated that, as a less preferable alternative, a crane with a jib attachment could be used to support the mast and one stiffleg while the derrick was being dismantled. John Koska, a compliance officer, agreed with the use of guy wires, but also suggested that, as an alternative, two cranes could be used to support the mast and a stiffleg.

hazard of the derrick collapsing on them. The judge also found that this hazard was recognized by the ironworking industry. Nevertheless, the judge concluded that State should not be found in violation of section 5(a)(1). The judge determined that State's four officers were riggers, were not members of the ironworking industry, and relied upon the crane crew and upon Mandeville to perform their part of the operation. The judge also noted that no one participating in the dismantling operation knew that the vertical mast was not bolted or cemented at the base. The judge further pointed out that Mandeville understood that he was to cut the stiffleg only part way, then move from the mast to the stiffleg, and that Mandeville cut too far. The judge therefore concluded that State had a right to rely upon the expertise of Mandeville, whose mental lapse it could not have foreseen or prevented.

III.

On review, the Secretary maintains that State violated section 5(a)(1) by neglecting to ascertain that the mast of the derrick was connected to the ground by only a ball joint. The Secretary contends that, contrary to the judge's conclusion, State either knew, or should have known, that the unsupported mast of the derrick was potentially unstable. In the Secretary's view, Mandeville was exposed to the hazard of falling from the derrick, and State's officers were exposed to the hazard of the derrick falling on them.[11/] The Secretary further maintains that State could have prevented the collapse of the mast by

---

11/ The Secretary takes exception to the judge's conclusion that Mandeville was an independent contractor, and the Secretary argues that Mandeville should be found to be an employee of State for purposes of the Act. However, we do not find it necessary to determine whether Mandeville was an employee since we agree with the judge that State's officers were exposed to the hazard of the derrick falling on them. Neither party took exception to the judge's holding that State's officers were employees for purposes of the Act.

securing the mast with guy wires or other effective means.[12/]

To establish a section 5(a)(1) violation, the Secretary must show that an employer failed to render its workplace free from a hazard that is recognized and likely to cause death or serious physical harm to its employees. See Little Beaver Creek Ranches, Inc., 82 OSAHRC _____, 10 BNA OSHC 1806, 1982 CCH OSHD ¶ 26,125 (No. 77-2096, 1982). The Secretary must also demonstrate that there were feasible means available to abate the hazard. Id; National Realty & Construction Co. v. OSHRC, 489 F.2d 1257, 1268 (D.C. Cir. 1973).

A recognized hazard is a condition or practice in the workplace that is known to be hazardous either by the industry in general or by the employer in particular. Beaird-Poulan, a Division of Emerson Electric Co., 79 OSAHRC 21/D11, 7 BNA OSHC 1225, 1979 CCH OSHD ¶ 23,493 (No. 12600, 1979); see Continental Oil Co. v. OSHRC, 630 F.2d 446, 448 (6th Cir. 1980), cert. denied, 101 S.Ct. 1481 (1981). The hazard in this case was the possibility of the mast and adjacent portions of the stiffleg derrick collapsing while it was being dismantled. Byrne, a business agent for the ironworkers' union, gave unrebutted testimony that the derrick was not properly dismantled and that the correct method of dismantling the derrick was to support the mast of the derrick with guy wires or a crane before a stiffleg was detached from the mast. The parties stipulated to Byrne's expertise with respect to the ironworking industry, and State's counsel stated that Byrne was "eminently qualified" concerning setting up and dismantling cranes. Therefore, we conclude that an employer engaged in the business of dismantling derricks should have known that the method used here to dismantle the derrick was improper and that the mast of the derrick should have been secured. Accordingly, we find that the hazard at issue in this case was recognized by the derrick-dismantling industry.

---

12/ State did not file a brief on review.

State's officers previously had worked as riggers and movers, and the contract with Bird was only State's second job. However, an employer who undertakes a project outside of its normal area of work cannot, on the grounds of its ignorance of the new area, be excused from obligations that apply to employers who normally work in that field. In this case, State sought the contract for dismantling the derrick and State undertook the project. Consequently, State should be held responsible for recognizing hazards inherent in dismantling derricks.

The judge concluded that State should not be found in violation of section 5(a)(1) since State had a right to rely upon the expertise of Mandeville, an ironworker. However, State, rather than Mandeville or the crane company, was responsible for the overall management of the dismantling operation. State obtained the contract for the project, undertook the work, and State's four officers were taking part in the project at the time of the incident. Moreover, Mandeville had no expertise in dismantling derricks, and State did not ask whether he was knowledgeable about derricks when it engaged him to cut the stifflegs. Additionally, before the project began, Pompeii was told by the crane company's president that he knew nothing about dismantling derricks. Therefore, State could not have relied on the derrick-dismantling expertise of Mandeville or the crane company. Thus, under the circumstances of this case, State must be held responsible for assuring that the derrick was dismantled safely. If State lacked the expertise to accomplish the work safely, as appears to have been the case, then it should have hired others with sufficient expertise to plan and supervise the project, which it also failed to do.

Pompeii, State's president, testified that he did not realize until just before the collapse of the derrick that Mandeville was cutting the stiffleg.

Pompeii stated that he thought that Mandeville was in the process of attaching guy wires. This testimony was not discussed by the judge and conflicts with testimony given by the crane operator, Imperatore. However, even assuming that Pompeii did not realize that Mandeville was cutting the stiffleg until shortly before the derrick collapsed, this does not relieve State of responsibility for the alleged violation. As general contractor, State was responsible for assuring that the work was accomplished according to a safe work plan.[13/] See, e.g., National Industrial Constructors, Inc., 81 OSAHRC _____, 10 BNA OSHC 1081, 1981 CCH OSHD ¶ 25,743 (No. 76-4507, 1981). Crane operator Imperatore, however, had rejected Pompeii's instructions to have the crane support both stifflegs while the derrick was being dismantled. Rather, Imperatore had stated that he would take the derrick down the way that he felt was best, and Pompeii, apparently acquiescing in this, let the work proceed. Thus, Pompeii did not assure that a safe procedure would be used to dismantle the derrick, but rather relinquished selection of a dismantling method to the crane operator. Since State's president neglected to ascertain whether a proper method was to be used to dismantle the derrick, his asserted failure to realize until the last moment that Mandeville was cutting the stiffleg does not relieve State of responsibility for the improper manner in which the derrick was being dismantled.

The judge noted that Mandeville cut the stiffleg "too far" before he attempted to move from the mast to the supported stiffleg. The judge therefore concluded that State could not have foreseen or prevented Mandeville's "mental lapse." However, Byrne testified that Mandeville's cut of the stiffleg from the unsupported mast was an improper method of dismantling the stiffleg, and

---

13/ Chairman Rowland would not rely on State's status as a general contractor as a basis for finding that it committed a violation but instead would rely upon State's role, as detailed above, in undertaking and carrying out the dismantling of the derrick.

that the mast and stifflegs of the derrick needed to be supported during the dismantling operation. Therefore, whether Mandeville cut too far is irrelevant, since a proper method for dismantling the derrick would have required that the derrick be adequately supported during the dismantling operation.

The record indicates that the likely result of an employee being struck by the falling 62-foot high mast and stiffleg would be death or serious injury. Moreover, the feasibility of abatement in this case is clear. The evidence establishes that the collapse of the derrick could have been prevented by securing the mast with guy wires or by securing it with another crane.

For the reasons discussed above, the criteria for a section 5(a)(1) violation have been met. Considering the gravity of the violation and State's size, good faith, and prior history, we conclude that a penalty of $600 is appropriate. Based upon both the extreme danger posed by the collapse of the derrick and the unsafe method used by State to dismantle it, we find the gravity of the violation to be high. While State's efforts at protecting its employees' safety were inadequate, we do not find such lack of protection to be the result of a lack of good faith. We also note that State is a small employer with no history of previous violations.

V.

For the foregoing reasons, we reverse Judge Gold's decision with respect to the section 5(a)(1) citation and we find State in violation of section 5(a)(1). We assess a penalty of $600.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.

UNITED STATES OF AMERICA

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br>Complainant<br>v.<br>STATE MOVING-TRUCKING, INC.,<br>Respondent | OSHRC DOCKET NO. 77-1971 |

APPEARANCES:

Complainant: Merle Hyman, Attorney

Respondent: Robert F. Arrigan, Esq.

DECISION AND ORDER

On May 17, 1977 an ironworker fell 62 feet to his death while taking part in the dismantling of a stiffleg derrick.[1/] The deceased, sitting high on the mast, had cut through a stiffleg with an oxyacetylene torch, when the mast fell.

As a consequence, Respondent was issued a serious citation alleging two violations. A single penalty of $600 was recommended by Complainant.

---

1/ A stiffleg derrick is a fixed derrick whose mast, capable of being rotated, is supported or held in place in a vertical position by two or more stifflegs (rigid members) one end of each being connected to the top of the mast, and the other end securely anchored. 29 CFR 1910.181(a)(9). ANSI B30.6-1969, Secs. 6-0.2.1.9 and 6-1.2.3a.

Respondent contested both charges. Trial was held on December 19, 1977 at Providence, Rhode Island, pursuant to Section 10(c) of the Occupational Safety and Health Act.

Respondent corporation, located at Providence, Rhode Island, admittedly is engaged in interstate commerce (Tr. 4). I find that the Commission has jurisdiction over the parties and the subject matter.

Item 1a of the citation charges a violation of Section 5(a)(1) of the Act in that an "ironworker dismantling stiffleg derrick, working high above pavement, was not provided with a safe working surface, or equivalent protection."

John Pompeii, President of Respondent, has been a rigger and mover for 38 years (Tr. 138). He and three others, being out of work, formed their own corporation on April 5, 1977 (Tr. 139, 160). On April 27 the corporation submitted a bid to Bird & Son (Tr. 15), and was awarded a contract to dismantle a stiffleg derrick and clean the area for $1,500 (Tr. 15-16). This was only its second job (Tr. 158).

Bird had decided to remove the derrick because it had not been used for 22 years and was rusting (Tr. 14).

In order to carry out the dismantling of the derrick Respondent hired a 30-ton crane from Gansett Crane Service for $365 (Tr. 29, 140-141, 172, 174). Along with the crane Gansett supplied a crane operator and oiler (Tr. 42). Since Respondent also decided that it needed someone to climb and cut the stifflegs with a torch, Pompeii

asked Peter D'Ambruoso, President of Gansett, during a telephone call on May 15 if he knew anyone out of work (Tr. 19-20). D'Ambruoso replied that he had just heard from a journeyman, and at Pompeii's suggestion D'Ambruoso called David Mandeville and eventually arranged that the latter do the job for $75 (Tr. 20-21).[2/]

According to D'Ambruoso, Mandeville did not know how to reach the Bird location, so Mandeville was told to come to Gansett on the morning of May 17 and ride with the crane to the worksite (Tr. 22). Mandeville drove a Gansett auxiliary truck to the worksite, accompanying the crane (Tr. 44-45).

The Gansett crane crew and Mandeville arrived at the Bird yard at about 7:30 a.m. on May 17 (Tr. 33). The crane operator had hooked up the crane boom with guy wires to one stiffleg so as to hold it up while Mandeville was cutting that stiffleg (Exh. C-20, Tr. 48-50). Mandeville climbed the derrick mast, the first 40 feet on a ladder and the rest of the way on the mast webbing until he reached the top (Tr. 63); he cut through the stiffleg held up by the crane and

---

2/ D'Ambruoso testified that Mandeville had contacted him on May 15, and asked if D'Ambruoso had work for him or knew of any available job (Tr. 18-19). Mandeville, an ironworker for 8-10 years, had worked for him during most of 1976 and for 5-7 weeks in 1977, the last time during the week of March 9, 1977 (Tr. 18, 23-24). Mandeville had worked for General Gansett Corporation, which erects steel structures, and employs ironworkers (Tr. 172). The Gansett corporation involved in the instant case is Gansett Crane Service which is engaged solely in the rental of cranes, and in that connection never employs ironworkers (Tr. 172).

tried to climb onto it, but the mast and the other stiffleg fell before Mandeville could make the move (Tr. 37-38). Mandeville was to have cut part way, move onto the leg supported by the crane, and then complete the cut (Tr. 63). Pompeii declared that when Mandeville shouted that he had an inch to go, he (Pompeii) hollered, "No, no," but it was too late (Tr. 147-148). The tragedy occurred at about 10:30 a.m. (Exh. C-36). The reason for the collapse of the mast was that the mast, at the bottom, had nothing more than a ball joint, and was held in place only by the stifflegs (Tr. 70, 87). The mast was without support when the attached stiffleg was cut away from the mast (Tr. 70).

Respondent contends that Mandeville was not its employee, but was an independent contractor, and therefore the Section 5(a)(1) charge cannot lie. Additionally, Respondent argues that even if it is found that Mandeville was in its employ, Complainant has not established the existence of a recognized hazard and has failed to demonstrate the manner in which Respondent's conduct fell short.

Section 5(a)(1), 29 U.S.C. §654(a)(1), the so-called general duty clause, requires that each employer

> "shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees."

The expression "recognized hazard" means (1) generally recognized as a hazard by the employer's industry or (2) actually recognized as a hazard by the employer. Secretary of Labor v. OSHRC and Vy Lactos, 494 F.2d 460, 464 (8th Cir. 1974).

The Act furnishes little assistance as to the meaning of "employer" or "employee". Under Section 3(5) "employer" means "a person engaged in a business affecting commerce who has employees, but does not include the United States of any State or political subdivision of a State." The term "employee" is defined in Section 3(6) as "an employee of an employer who is employed in a business of his employer which affects commerce."

Pompeii asserted that he did not regard Mandeville as his employee (Tr. 143); that he thought that Mandeville came with the crane (Tr. 154). The $75 charge for Mandeville's services were to be added to the Gansett bill to be paid by Respondent (Tr. 141-142, 154). The $75 was never paid by Respondent or Gansett (Tr. 31, 157), and Gansett billed Respondent for only $300 for the crane (Tr. 30-31, 157).

As far as Gansett was concerned, D'Ambruoso declared that Mandeville was not working for him (Tr. 31).

Complainant presented Ralph Imperatore, the Gansett crane operator, who testified that he asked Mandeville for whom he was working and who was paying him; and that Mandeville replied, "They are." Imperatore claimed that he then asked, "Who is they?" and that Mandeville said, "The guy I'm going to work for." (Tr. 42). This was offered by Complainant in an effort to show that the deceased regarded himself as an employee of Respondent. However, that conversation was less than clear.

The crucial test in determining whether Mandeville was an independent contractor is whether he was engaged to do a certain piece

of work according to his own judgment and methods without being subject to the control of Respondent except as to the result of the work. Linstead v. Chesapeake & Ohio R. Co., 276 U.S. 28 (1928). Standard Oil Co. v. Anderson, 212 U.S. 215 (1909).

As an ironworker Mandeville possessed and exercised a certain expertise. D'Ambruoso acted as a go-between in arranging for Mandeville to do one specific job for Respondent, that of dismembering a derrick. The work was to last one day, perhaps two. Mandeville was to be paid a fixed sum by Respondent, regardless of the time involved. Mandeville operated on his own (Tr. 50, 55, 56). On the basis of this record I find that Respondent did not retain the right of control or supervision over Mandeville as to details, and that for the purposes of the Occupational Safety and Health Act Mandeville was not an employee, but was an independent contractor unprotected by Section 5(a)(1) of the Act.

However, there were employees of Respondent at the site, and they were exposed to danger at a place of employment which was not free from a hazard so recognized in the ironworking industry.

Except for one part-time summer employee, Respondent corporation consisted of its four officers, experienced riggers (Tr. 83-84, 156, 160-161, 164). All four were at work at the site when the mast collapsed (Tr. 77).

Holding stock in a corporation is not necessarily inconsistent with being an employee of the corporation. In United States v. Bernstein, 179 F.2d 105, 114 (4th Cir. 1949) the Court held that

an officer of a corporation may or may not be its employee, dependent upon the facts and circumstances of his particular relationship to the corporation. In the case at hand, the officers contributed substantial services on a regular basis. Bearing in mind that the Congress intended that the term "employee" be given the broadest possible interpretation, it is found that the four corporate officers were employees of Respondent corporation, and as such are under the protective cover of the Act.

This leads to the question whether Respondent corporation was in violation of Section 5(a)(1) of the Act with respect to its four officer-employees at the site. Martin Byrne, business agent for Local 237, Ironworkers Union, testified that he was an ironworker for 20 years (Tr. 86); that he was at the site a half hour after the death (Tr. 88); that no employees of Respondent belong to the ironworkers union (Tr. 99); that the correct method of dismantling a stiffleg derrick is to first place temporary guy wires on the mast to hold it in place (Tr. 87, 101-102).

Unfortunately, Pompeii, D'Ambruoso, and the crane operator did not know that the vertical mast was not bolted or cemented into a fixed position at the base (Tr. 25, 56, 70). No one participating in the dismantling operation seemed to know this fact (Tr. 56).

Section 2(b) of the Act declares that its purpose is "to assure so far as possible every working man and woman in the Nation safe and healthful working conditions." The record firmly demonstrates that the workplace was not free of a hazard. However, the Congress

did not mean to impose strict liability upon employers, as evidenced by the language of Section 2(b) of the Act. Respondent's four officers were riggers. They relied upon the crane crew to perform its function, and depended upon Mandeville to perform his part of the operation. Respondent was not a part of the ironworking industry. Mandeville understood that he was to cut the stiffleg only part way, then move from the mast to the stiffleg supported by the crane. He cut too far. In these circumstances, I find that Respondent had a right to rely on the expertise of the deceased, whose mental lapse Respondent could not have foreseen or prevented. The charge in item 1a will be ordered vacated.

Item 1b alleges a violation of Section 5(a)(2) of the Act, 29 U.S.C. §654(a)(2), for failure to comply with the safety standard at 29 CFR 1926.850(a), which reads:

> Subpart T - Demolition
>
> §1926.850 Preparatory operations.
>
> (a) Prior to permitting employees to start demolition operations, an engineering survey shall be made, by a competent person, of the structure to determine the condition of the framing, floors, and walls....

I find that item 1b has not been sustained both from a factual standpoint and as a matter of law.

The OSHA compliance officer who visited the site after the accident testified that he asked Pompeii whether an engineering survey had been conducted, and that Pompeii replied that he had thought that the vertical mast was bolted in at the bottom and

would remain vertical after one stiffleg was cut away (Tr. 70). This evidence does not suffice as proof that there was no survey. Pompeii testified at the trial, but was never questioned on this point.

In any event, it is my view that the standard does not apply to the facts herein. Section 1926.850(a) is limited to demolition operations. However, the derrick was not being demolished, -- it was being dismantled. By citing this standard the Secretary has gone outside the bounds of the normal meanings of words. In normal usage, to "demolish" an object means to destroy it, whereas to "dismantle" something is to separate it into its constituent parts in a non-destructive manner. The specific forms of demolition referred to in Subpart T are mechanical demolition by clamming or balling (§1926.859) and demolition by explosives (§1926.860). The derrick in the instant case was being dismembered, not destroyed. Since it was not being demolished, the operation was not within the purview of the cited standard.

Moreover, the standard applies only to the demolition of buildings. It demands a survey "to determine the condition of the framing, floors, and walls." A stiffleg derrick has no framing, floors, and walls. Subpart T refers, time and again, to floors, walls, and buildings. In the eleven subsections of 1926.850 the word "wall(s)" appears in four, "floor(s)" in five, "building" in two. Gas, electric, and other utilities are also discussed in two. The language throughout 1926.850 makes it plain that it is intended to protect against hazards encountered in connection with the destruction of buildings, and has no application

to the dismantling of a stiffleg derrick.

In light of the foregoing, it will be ordered that item 1b be vacated.

## CONCLUSIONS OF LAW

1. Respondent engages in a business affecting commerce, and the Occupational Safety and Health Review Commission has jurisdiction over the parties and the subject matter within the contemplation of 29 U.S.C. §§652 and 653(a).

2. On May 17, 1977 Respondent did not violate 29 U.S.C. §654(a)(1).

3. On May 17, 1977 Respondent did not violate 29 U.S.C. §654(a)(2) for noncompliance with the standard at 29 CFR 1926.850(a).

## ORDER

It is ordered that items 1a and 1b of the serious citation of May 27, 1977 be vacated.

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

This case is before the Commission on interlocutory appeal[1] of an order entered by Administrative Law Judge James D. Burroughs denying a motion by the Secretary of Labor ("the Secretary") to withdraw a citation previously issued to and contested by Respondent, Republic Steel Corporation ("Republic"). The Secretary had based his motion on the ground that there was insufficient evidence to establish a violation of the cited standard at the time and place alleged in the citation. However, the United Steelworkers of America, Local Union 1200 ("the Union"), an authorized employee representative, had objected to the Secretary's motion on the ground that withdrawal of the citation would leave

[1]See Commission Rule 75, 29 C.F.R. §2200.75.

the hazardous conditions described in the citation uncorrected. The judge denied the Secretary's motion because (1) the Union had objected and (2) it had asserted that it was prepared to offer evidence to establish the alleged violation.

The judge implicitly rejected the arguments raised by the Secretary and Republic in opposition to the Union's right to object. We affirm his disposition of these issues. The interests of an authorized employee representative that has elected party status in a timely manner are not restricted, as Republic argues, to the reasonableness of the abatement period. Mobil Oil Corp., 82 OSAHRC _____, 10 BNA OSHC 1905, 1982 CCH OSHD ¶ 26,187 (No. 77-4386, 1982). The Union, as a party in this case, may object to the Secretary's motion to withdraw the citation. Cuyahoga Valley Railway Co., Docket No. 76-1188 (October 29, 1982).

Nevertheless, we conclude that the judge erred in denying the Secretary's motion to withdraw. The judge should have deferred ruling on the Secretary's motion until a hearing could be held on the Union's objections and a determination could be made as to whether the Secretary's motion is consistent with the provisions and objectives of the Act.[2] See Cuyahoga Valley Railway Co., supra.

After the judge had certified this case for interlocutory appeal, the Union filed a motion to immediately enforce the citation in full. In response, we entered an order in which we reserved a ruling on that motion pending a decision on the merits of this interlocutory appeal. Because Republic has not withdrawn its notice of contest of the citation and no hearing has been held on the merits of the alleged violation, we cannot enter an order affirming the citation at this time. For this reason, the Union's motion is denied.

---

[2] If the judge again denies the Secretary's motion after a hearing on the Union's objections, he must then schedule the case for a hearing on the merits. If the Secretary declines to prosecute the case on the merits, Commissioner Cleary would permit the Union to prosecute. Mobil Oil Corp., supra (concurring opinion). Commissioner Cottine presumes that the Secretary will proceed appropriately on the merits if the Union's objections are found to be meritorious and the withdrawal motion is denied. See Dunlop v. Bachowski, 421 U.S. 560, 574-76 (1975).

Accordingly, we set aside the judge's order and remand the case[3] to Judge Burroughs to consider the Union's objections to the withdrawal of the citation.[4]

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: NOV 30 1982

---

[3]We note that Commission Rule 61, 29 C.F.R. § 2200.61, places strict limitations on the postponement of a hearing by a judge.

[4]Chairman Rowland adheres to his position in Mobil Oil Corp., supra (dissenting opinion) and in Cuyahoga Valley Ry. Co., supra, slip op. at p. 6 n.6. The Chairman believes that the decision to withdraw a citation is within the prosecutorial discretion of the Secretary. For this reason, he would reverse Judge Burroughs' order and grant the Secretary's motion to withdraw the citation.

## ORDER GRANTING COMPLAINANT'S AND RESPONDENT'S MOTIONS FOR CERTIFICATION OF INTERLOCUTORY APPEAL

On September 22, 1981, a motion for certification of interlocutory appeal was received from counsel for respondent. On September 23, 1981, a similar motion was received from counsel for complainant. The motions having been read and considered, it is

ORDERED: That the motions are granted pursuant to Commission Rule 75(b).

Dated this 24th day of September, 1981.

Boston, Massachusetts 02109

## NOTICE OF DECISION

Secretary of Labor v. United States Steel Corporation, American Bridge Division
OSHRC Docket No. 82-168

1. Enclosed is a copy of my decision. It will be filed with the Commission on November 1, 1982, and will become the final order of the Commission on December 1, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is December 1, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

JUDGE'S DECISION
NOV 1 '82
RECEIVED
FINAL ORDER ON
DEC 1 '82

APPEARANCES:

Ronald Glover, Esq., for Complainant

James T. Carney, Esq., for Respondent

DECISION AND ORDER

This case arose under 29 USC, sec. 651 et seq. of the Occupational Safety and Health Act of 1970 (the Act). As a result of an inspection by the Occupational Safety and Health Administration (OSHA) of the Respondent's premises on or about January 27, 1982, Citation #1 was issued on or about February 4, 1982, charging in Item #2 that the Respondent violated sec. 5(a)(2) of the Act by the serious violation of the standard at 29 CFR 1926.28(a) in that welders were not required to wear personal protective equipment to protect against thermal burns while performing electric arc welding and gouging.

Citation #1 also charged in Item #1 that the Respondent violated sec. 5(a)(1) in that there were slippery floor conditions.

On or about February 9, 1982, the Respondent filed Notice of Contest to Items 1 and 2 of Citation #1 and the penalties proposed therefor, but the Respondent withdrew its Notice of Contest to Item 1.

The pertinent sections of the Act and the standard in question are appended to this decision under appropriate titles.

## ISSUES

Although there was considerable testimony concerning a dispute between the employees and the Respondent as to who should provide personal protective equipment, and whether employees should have been discharged for insubordination, we should not lose sight of the fact that neither of those issues was the gravamen of the citation. Regardless of who had the obligation of providing personal protective equipment, the questions to be decided are:

1. Was the equipment that was worn by employees on or shortly before January 27, 1982, appropriate for the conditions of employment?
2. Did the Respondent take every reasonable step to require the employees to wear appropriate personal protective equipment?

## PRELIMINARY

The employees affected by the alleged hazardous conditions were welders who were working on various floors of a multi-story building being erected by the Respondent. The kinds of welding being done included processes designated by the witnesses as arc gouging, air arcing, stick, inner shield, automatic, semi-automatic, etc.

In stick welding, a rod or electrode is put in a holder, electric current is generated, and two pieces of metal are joined when the rod or electrode is consumed into the weld. Inner shield welding is basically the same process except that a coil of wire is used instead of the rod, resulting in much hotter temperatures. In arc gouging [or air arcing] a copper coated carbon rod

is used. After the metal is heated into a molten state, compressed air blows away the excess.

The point of welding was in various places and, depending on its location, the welder might be below it, above it, beside it, facing it, etc.

The working position of the welder also varied, as he might have to stand on a deck, straddle a beam, sit on a scaffold, balance himself on a "float", etc. [A "float is a 4 x 6 foot platform suspended alongside a building by ropes.]

The degree of hazard to the welder differed with the location and kind of weld. For example, there is obviously a greater hazard of sparks falling on the welder from an overhead weld than from one below the waist; and an insecure position on a "float" or in a confined space permits less mobility and agility in combatting flames than one on a solid floor.

## APPROPRIATE PROTECTIVE EQUIPMENT

All the witnesses testified that sparks or flames from at least some of the welding operations could fall upon the wearing apparel of the welders. For that reason, one issue is whether the protective equipment worn by the employees was appropriate. That equipment varied from ordinary clothing to "leathers", which might include a leather jacket, leather sleeves, leather pants or leggings, etc. Since the welding involved temperatures as high as 1500 - 2000 degrees (depending on the weather and the type of welding) it is obvious that there was a hazard from "a shower of sparks" or molten metal or flames caused by the welding process. The evidence clearly indicated that ordinary clothing was more likely to catch fire than "leathers". Moreover, some types of apparel (e.g. leather jacket) gave more protection to the wearer than ordinary clothing because leather is not only more flame-resistant but

its composition is such that sparks tend to "bounce" off it rather than to become imbedded in it. It is clear that, for at least some of the welding conditions that existed at the worksite, ordinary clothing was not "appropriate personal protective equipment" and that some sort of leather covering would have reduced the hazard to employees.

## REQUIRE THE WEARING

The evidence is overwhelming that the Respondent did not "require" the wearing of personal protective apparel of any kind, whether it be even just ordinary clothing. The Respondent's position was that the welders themselves were responsible for deciding what they wanted to wear. That was not only the testimony of the employees and the Respondent's Superintendent [Gibson] but it was also so stipulated by the Respondent...Tr. 92.

The Respondent's policy on this point is emphasized by its very strict rule concerning hard hats and safety belts: the employee wore them or was not permitted to work. There was no comparable policy for personal protective equipment for welders; on the contrary, it was customary [on the date of the inspection and for the months before it] for welders to work in any kind of clothing and with or without personal protective clothing of any sort.

The Respondent eventually did take stern disciplinary action against employees but, even if such action be interpreted as enforcement of a rule requiring employees to wear adequate personal protective equipment, such action came long after the inspection. While it may have some bearing on the penalty to be imposed, it does not excuse the violation.

## KNOWLEDGE

Supervisory personnel knew of all the conditions at the jobsite; and also knew that employees often did various kinds of welding while not wearing anything more than ordinary clothing...Tr. 49, 103, 104, 115, 145, 151, 174, 175, 273, 300, 311, 379.

## SERIOUS

Although the evidence did not show a particularly large number of cases of serious injury to welders, there was ample evidence of incidents from which the conclusion could be drawn that there was a substantial probability that serious physical harm could result from the welding operation. I draw that conclusion.

Several of the witnesses had either themselves had their clothing catch fire or had seen others put in similar jeopardy. Moreover, a description of the welding process as performed, for example, in a confined space or on a "float" would itself lead to the same conclusion...Tr. 97, 114-116, 143, 146, 170, 172, 212, 300, 307, 349, and Exh. C-1, 2, 3, 6, 9-14, 19.

## FINDINGS OF FACT

Having heard the testimony, observed the witnesses, and examined the exhibits, the following Findings of Fact are made:

1. At all times concerned, the Respondent regularly received, handled or worked with goods which had moved across state lines.

2. As concerns Item #2 of Citation #1, the Respondent did not require the wearing of appropriate personal protective equipment where it was needed to reduce the hazards to employees who were welding.

3. Some of the Respondent's welders wore ordinary clothing that could be ignited by sparks or flames caused by the welding operation.

4. The Respondent had no rules or procedures or customs or discipline or other practices that would require the employees to wear appropriate personal protective equipment to avoid or lessen hazards.

5. The conditions described in Item #2 of Citation #1 exposed the Respondent's employees to sustaining serious harm because of the hazard of burns from sparks or flames caused by the welding operation.

6. One or more officers or supervisory personnel of the Respondent knew of the hazardous conditions described herein and knew that employees were exposed to such hazard.

## CONCLUSIONS OF LAW

1. At all times concerned, the Respondent was an employer engaged in a business affecting commerce within the meaning of the Act; and the Occupational Safety and Health Review Commission has jurisdiction over the subject matter and the parties.

2. At all times concerned, the Respondent knew, or with the exercise of due diligence should have known, of the alleged violation.

3. On the date in question, the Respondent was not in compliance with the standard at 29 CFR 1926.28(a); and the Complainant has sustained the burden of proving the Respondent violated sec. 5(a)(2) of the Act (sec. 654).

4. The Respondent having withdrawn its Notice of Contest, the Complainant has sustained the burden of proving the Respondent violated sec. 5(a)(1) of the Act.

## ORDER

The whole record having been considered, and due consideration having been given to 29 U.S.C. sec. 666(j), it is ordered:

1. Item #1 of Citation #1 is affirmed and a penalty of $100 assessed therefor.

2. Item #2 of Citation #1 is affirmed and a penalty of $100 assessed therefor.

SO ORDERED.

Foster Furcolo

FOSTER FURCOLO
JUDGE, OSHRC

Dated: November 1, 1982
Boston, Massachusetts

## APPENDIX

## THE ACT

Section 654 [section 5(a)(1)] Employer "...shall furnish...a place of employment...free from recognized hazards...likely to cause death or serious physical harm to his employees; ..."

Section 654 [section 5(a)(2)] Employer "...shall comply with occupational safety and health standards..."

Section 666 [section 17(b)] "...employer who has received a citation for a serious violation...of this Act...shall be assessed a civil penalty of up to $1,000 for each such violation."

Section 666 [section 17(j)] "...assess all civil penalties...giving due consideration to...the size of the business...gravity of the violation, the good faith of the employer, and the history of previous violations."

Section 666 [section 17(k)] "...a serious violation shall be deemed to exist...if there is a substantial probability that death or serious physical harm could result...unless the employer did not, and could not...know of the presence of the violation."

## THE STANDARD

29 CFR 1926.28(a): "The employer is responsible for requiring the wearing of appropriate personal protective equipment in all operations where there is an exposure to hazardous conditions or where this part indicates the need for using such equipment to reduce the hazards to the employees."

Albert S. Wolf, Esquire, of Denver, Colorado
For the Respondent

DECISION AND ORDER

James A. Cronin, Jr., Judge, OSHRC:

On October 11, 1979, an abrasive wheel or blade on an abrasive cutting-off machine shattered, killing an employee of Howard Electric Company (Howard). Following a fatality investigation by compliance officers of the Occupational Safety and Health Administration (OSHA), the Secretary of Labor issued two citations to Howard charging it with a "serious" violation of Section 5(a)(1) of the Occupational Safety and Health Act of 1970 (29 U.S.C. §651 et seq.; hereafter called the "Act"), and a "willful" violation of 29 C.F.R. §1926.303(b) for failure to comply with "Sections 3.2 and 4.1, American National Standards Institute (ANSI) B7.1-1970, Safety Code for the Use, Care, and Protection of Abrasive Wheels . . .".

The Secretary proposed a $1,000.00 penalty for the alleged violation of section 5(a)(1) of the Act and $8,000.00 for the alleged violation of 29 C.F.R. §1926.303(b). Howard contested the alleged serious and willful violations and penalties, and a hearing was held at Denver, Colorado, on August 4, 1982.

Citation No. 1 describes the alleged violation of section 5(a)(1) as follows:

> 1
> Section 5(a)(1) of the Occupational Safety and Health Act of 1970: The employer did not furnish employment and a place of employment which were free from recognized hazards that were causing or were likely to cause death or serious physical harm to employees, in that:
>
> At the Eisenhower Tunnel, second floor of fan deck, the AEG Model WSD 2300S "Cut-Elec" portable abrasive cut-off machine was used with an un-marked, oversized, metal cutting blade to cut a camera opening in the concrete west wall.

Section 5(a)(1), 29 U.S.C. §654(a)(1), provides:

> Each employer--shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees.

Citation No. 2 describes the alleged violation of 29 C.F.R. §1926.303(b) as follows:

> 1
> 29 CFR 1926.303(b): Sections 3.2 and 4.1 American National Standards Institute B7.1-1970, Safety Code for the Use, Care, and Protection of Abrasive Wheels, as adopted by 29 CFR 1926.303(b):
>
> At the Eisenhower Tunnel, the AEG Model WSD 2300S "Cut-Elec" portable abrasive cut-off machine being used to cut a camera opening in the concrete west wall, second floor of fan deck, was being operated without a safety guard.

Section §1926.303(b) provides:

> §1926.303 Abrasive wheels and tools.
>
> * * *
>
> (b) Guarding. Grinding machines shall be equipped with safety guards in conformance with the requirements of

American National Standards Institute, B7.1-1970. Safety Code for the Use, Care and Protection of Abrasive Wheels, and paragraph (d) of this section.

Section 3.2 of ANSI Standard B7.1-1970 provides:

3.2 Safety Guards

Grinding machines shall be equipped with safety guards in conformance with the requirements covered in section 4 page 27.

Section 4.1 of ANSI Standard B7.1-1970 provides:

4.1 General Requirements

All abrasive wheels shall be used only on machines provided with Safety Guards as defined in the following paragraphs of this section.

Exceptions: This requirement shall not apply to the following classes of wheels and conditions.

(1) Wheels used for internal work while within the work being ground.

(2) Mounted wheels used in portable operations (see definition Sec. 1.4.18 page 15) 2 inches and smaller in diameter.

(3) Types 16, 17, 18, 18R and 19 cones and plugs and threaded hole pot balls where the work offers protection.

## Issues

Among other defenses, Howard's answer contends that the Commission lacks subject matter jurisdiction over this proceeding and personal jurisdiction over Howard. At the outset of the hearing, Howard's counsel filed a Statement of Position with respect to its asserted defenses of lack of jurisdiction. He also orally moved to dismiss the citation and to dismiss the complaint on the same grounds as stated in the Statement of

Position (Tr. 9, 22-23). Essentially, Howard argues that the Commission lacks jurisdiction because of the failure of the Secretary of Labor to file his complaint within the time permitted by applicable Commission rule, as extended by a Commission order.

Howard's post-hearing brief reiterates its jurisdiction defense and also maintains that the Secretary's evidence failed to substantiate the violations charged. In addition to its brief, Howard also filed a post-hearing motion to strike certain evidentiary exhibits and the testimony of a compliance officer relating to and concerning these exhibits. Each of Howard's contentions will be addressed.

## Jurisdiction

The facts relevant to this issue are as follows:

Howard's notice of contest to citations Nos. 1 and 2 was filed on April 14, 1980, and received by the Secretary of Labor on April 16, 1980. On April 30, 1980, the Secretary filed a Motion to Stay Proceedings Pending Consideration of Criminal Prosecution. This motion specifically requested that the Commission stay the requirement that the Secretary file his complaint, which the motion represented was due on May 6, 1980.

By order issued May 21, 1980, the Commission stayed the proceedings pending consideration of criminal prosecution "including the filing of a complaint," for 60 days. The stay expired on July 23, 1980 (allowing 3 days' additional time because of service by mail under Commission Rule 4(b)). No complaint was filed, and the Secretary did not request a further extension of time to file his complaint, on or prior to July 23, 1980.

On March 5, 1981, some 225 days after the stay had expired, the Secretary moved the Commission to extend the stay ordered on May 21, 1980,

for an indefinite period pending consideration by the Department of Justice of criminal prosecution. Although no complaint had been filed, no request was made in the motion to specifically stay the requirement of filing a complaint. The Commission granted the Secretary's motion on May 7, 1981. In granting this motion, the Commission made no reference concerning the filing of a complaint.

On February 1, 1982, the Commission ordered the Secretary to notify the Commission of the current status of the criminal prosecution and the expected date when a final decision "will be made" on whether criminal proceedings will be initiated under section 17(e) of the Act. The Commission also ordered the Secretary's counsel to request a continuance or lifting of the stay order within 20 days of February 1, 1982.

On March 11, 1982, in response to the Commission Order of February 1, 1982, the Secretary moved to vacate the May 7, 1981 stay order. No reference was made in the motion to filing a complaint, but accompanying this motion was the Secretary's complaint. Attached to the motion was a certificate of service representing that the motion and complaint had been served on the respondent Howard.

On March 25, 1982, before the Commission ruled on the Secretary's motion to vacate the stay, Howard filed with the Commission its answer to the complaint. By order dated March 31, 1982, the Commission granted the Secretary's motion to vacate the stay order. The March 31st order contained no reference to the filing of the complaint.[1/]

1/ The case file, however, reflects that one Commissioner voted to "grant the Secretary's motion to vacate," and "accept for filing the Secretary's attached complaint." (See section 12(g) of the Act which requires: "every official act of the Commission shall be entered of record, and its hearings and records shall be open to the public.")

This record clearly establishes that this Commission has both subject matter jurisdiction over the proceeding and personal jurisdiction over the respondent Howard. Respondent's jurisdictional defenses, therefore are rejected.

This Commission's jurisdiction and powers to adjudicate proceedings initiated under the Occupational Safety and Health Act of 1970 derive solely from the provisions of that Act.

Section 10(c) of the Act specifically authorizes, and grants jurisdiction to, the Commission to adjudicate proceedings initiated under the Act whenever (as was done here) an employer timely contests a citation issued by the Secretary of Labor.[2/] Section 12(i) of the Act also makes section 11 of the National Labor Relations Act (29 U.S.C. 161) applicable to the jurisdiction and powers of the Commission. The Act further authorizes the Commission to "make such rules as are necessary for the orderly transaction of its proceedings." (See section 12(g) of the Act).

A complaint is a creature of the Commission's Rules of Procedure and a mandatory pleading requirement of the Commission, not the Act. See Asarco Inc., 80 OSHARC 99 A/3, 8 BNA OSHC 2156, 1980 CCH OSHD ¶24,838 (No. 79-6850, 1980; Commission Rule 33(a)). The Act neither mentions the need for a complaint nor imposes any jurisdictional time limits on the filing of a complaint.

Rule 33 (a)(1) mandates that the Secretary file a complaint within twenty (20) days after the Secretary has received a notice contesting

2/ Commission and Court precedent also hold that the Commission retains jurisdiction to grant appropriate relief under Rule 60(b) of the Federal Rules of Civil Procedure even when the notice of contest was untimely. See Banciforte Builders, 81 OSAHRC 80/A5, 9 BNA OSHC 2113, 1981 CCH OSHD ¶25,076, 25,591 (No. 80-1920, 1981); J. J. Haas Co., Inc., 648 F.2d 190 (3rd Cir. (1981).

his citation. Commission Rule 5 further provides that requests for extension of time for the filing of "any pleading" must be received in advance of the date on which the pleading is due to be filed.

As correctly pointed out by the Secretary in his brief, however, these rules, as well as all other Commission Rules of Procedure, are simply that, procedural rules. They do not impose jurisdictional limitations on the authority of the Commission to adjudicate proceedings initiated by the filing of a notice of contest; and the Secretary's failure to comply with their provisions does not deprive the Commission of its jurisdiction to adjudicate. Neither the Commission Rules of Procedure nor the Federal Rules of Civil Procedure were designed to affect jurisdiction.

Commission Rule 38 does provide that the failure to file any pleading "pursuant to these rules when due, may, in the discretion of the Commission or the Judge, constitute a waiver of the right to further participation in the proceedings." But this rule is plainly discretionary and does not mandate dismissal in the event the Secretary fails to file a timely complaint.

Personal and subject matter jurisdiction in this proceeding were established the moment Howard filed its notice of contest to the citation and its answer to the complaint. The complaint's allegations properly invoked the Commission's jurisdiction, and Howard admitted that it was an employer with employees and was engaged in a business affecting commerce.

Howard's Statement of Position indicates that Howard has confused the defenses of lack of jurisdiction with a defense grounded on the filing of an untimely and unauthorized complaint. Despite this misdesignation of defenses by Howard, however, the answer and motion

to dismiss will be treated as raising the issue of whether vacation of the Secretary's complaint under Commission Rule 38 is required or warranted.

Determination of this issue requires review and analysis of relevant Commission case law which has imposed limitations on a Judge's discretion to vacate citations for failure of the Secretary to comply with the Commission's Rules of Procedure.

Following its decision in Asarco, supra, which held that Rule 33(a)(1) was a mandatory pleading requirement, the Commission issued a series of decisions concerned with defining the scope of a Judge's discretion in vacating a citation or notice of contest for failure of a party to comply with the Commission's Rules of Procedure.

In The Boardman Company, 80 OSAHRC 122/C11, 9 BNA OSHC 1163, 1981 CCH OSHD ¶25,017 (No. 80-75, 1980), the Commission held that a citation should not be dismissed for failure of the Secretary to file a timely complaint unless the Secretary's noncompliance with Rule 33(a)(1) results from his contumacious conduct or results in prejudice to the respondent. This holding was reaffirmed in Refractory Construction Inc., 80 OSAHRC 128/D7, 9 BNA OSHC 1192, 1981 CCH OSHD ¶25,088 (No. 80-1416, 1980) and Henry C. Beck Co., 80 OSAHRC 128/E1, 9 BNA OSHC 1191, 1981 CCH OSHD ¶25,087 (No. 80-1612, 1981).

Howard cites this Judge's decision in TRG Drilling Corporation, 81 OSAHRC 108/D10, 10 BNA OSHC 1268, 1981 CCH OSHD ¶25,837 (80-6008, 1981) in support of its motion to vacate. There, this Judge held that the filing of an untimely complaint has no force and effect without authorization by the Commission, and the complaint must be stricken or

dismissed on motion. In that case it was further held that the Secretary's unexplained failure to file a timely complaint was deemed a waiver under Rule 38 of the Secretary's right to further participation in the proceeding and ground for vacation of the citation. In affirming this Judge's action in vacating the citation, the Commission did not discuss or allude to his holding that an unauthorized, untimely complaint must be stricken on motion. Instead, the Commission simply equated the Secretary's unexplained failure to comply with Rule 33(a)(1) with contumacious conduct and held that vacation of the citation was not an abuse of the Judge's discretion.

This Commission holding, of course, is clearly consistent with the Commission's prior decision in Rollins Outdoor Advertising, 77 OSAHRC 24/C1, 5 BNA OSHC 1041, 1042, n. 3, 1977-78 CCH OSHD ¶21,551 (No. 12528, 1977). Although the Judge in that case was reversed, the Commission held that the Judge's action in vacating an unexplained failure to file a timely complaint was not an abuse of discretion. In that case the Judge was reversed because the Secretary satisfactorily explained on appeal his failure to timely request an extension of time to file his complaint and his failure to file a timely complaint, and because the respondent employer had suffered no prejudice. Unlike in Rollins, however, the Secretary in TRG failed to offer a satisfactory explanation on appeal.[3/]

Applying the above Commission precedent to this case, Howard's motion to dismiss is denied. Contrary to the Secretary's contention, the complaint here was not filed either in accordance with the twenty-day provision of

3/ This Judge suggests that, absent exceptional circumstances, the Secretary's explanation for filing an untimely complaint should not be considered on appeal unless made before the Judge.

Rule 33(a)(1) or in compliance with the Commission order of May 28, 1980, which granted the Secretary an additional 60 days within which to file his complaint. But in this Judge's view, the late filing, although unexplained, was authorized by the Commission when it granted the Secretary's motions to extend the stay and to vacate the stay. The complaint was attached to the motion to vacate, and it is reasonable to assume that all three Commissioners were aware of the untimely complaint. Moreover, the Secretary's brief makes clear why no explanation for the untimely filing was ever offered on March 11, 1982, or subsequently. The Secretary contends the filing of the complaint was timely because he considers the second stay of May 7, 1981, by the Commission as a waiver of the May 28 60-day requirement. Although one may disagree with the Secretary's reasoning, his actions do not approach the level of contumacious conduct which would require vacation of the citation.

Howard also has not demonstrated in its oral argument or in its Statement of Position that any prejudice resulted from the Secretary's noncompliance with any of the Commission's Rules of Procedure. Howard never opposed the Secretary's motions to stay or his motion to vacate the stay. Instead, Howard waited until the day of the hearing to clarify his contentions concerning the untimely complaint. But more importantly, Howard has never claimed or demonstrated that the untimely complaint adversely affected its ability to defend against the charges of the citation.

Unable to find contumacious conduct on the part of the Secretary or prejudice to Howard, this Judge must deny Howard's motion to dismiss.

## Motion to Strike

After the hearing, Howard moved to strike the Secretary's photographic exhibits C-3, C-4, C-5, C-6, C-7, and C-8, together with all of the testimony of the Secretary's witness, Ivan Blood, relating to or concerning the objects shown in those exhibits.

These exhibits were received in evidence over the objections of Howard's counsel. The objections to each were similar, "irrelevancy and immateriality" (Tr. 44, 52, 54, 55, 57, 63-64, & 71). Also, Howard objected to Mr. Blood's testimony with respect to the alleged hazard depicted in Exhibit C-7 on the grounds of incompetency, irrelevance and immateriality (Tr. 57-59, 63-64, 72).

In overruling Howard's objections, this Judge admitted all of these exhibits "subject to connection," or proof that the objects shown in the photographs C-3 through C-7, and the manufacturer's catalogue, C-8, were involved in the incident at issue. This Judge indicated that if the Secretary failed "to connect" the photographed objects with this case, he would entertain a motion to strike "at the end of the case" (Tr. 45, 52, 54, 55, 59, 63-64, 71, 72).

The Secretary expressly offered exhibits C-3 through C-7 through Mr. Blood as photographs of objects having a direct part in the incident resulting in issuance of the citations and the hearing. Such objects are commonly called "real" or "original" evidence and are to be distinguished from evidence not playing a direct role but offered for illustrative or other purposes. When real evidence (or a photograph thereof) is offered, an adequate foundation for admission requires testimony that the object offered is the object which was involved in the incident and

that the condition of the object is substantially unchanged. Unquestionably, Mr. Blood was competent to testify that Exhibits C-3 through C-7 were accurate representations of the cut-off saw, guard and shattered abrasive wheel observed by him. However, he lacked personal knowledge of the objects in question or their prior condition, and, therefore, was incompetent to testify that the objects were directly involved in the October 11th incident. See Rule 602 of the Federal Rules of Evidence This is also true with respect to Exhibit C-8, the manufacturer's catalogue. The catalogue was relevant only if the model WSD 2300S shown on page 31 was the same model saw observed and photographed by Mr. Blood and shown in Exhibit C-3. Mr. Blood admittedly did not have personal knowledge of the model number of the saw in C-3 and, therefore, was incompetent to testify that the saw in C-3 was AEG model WSD 2300S. Of course, even if Mr. Blood had been able to testify of his own knowledge that the saw shown in C-3 was the same as WSD 2300S, the relevancy of Exhibit C-8 also would rest on establishing that the saw in C-3 was involved in the October 11th incident.

Exhibits C-3 through C-7 were admitted subject to the introduction of additional evidence sufficient to support a finding that the saw, guard and abrasive wheel pictured were involved in the October 11th incident. See Rule 104(b) of the Federal Rules of Evidence. In this Judge's view, the Secretary introduced sufficient evidence to fulfill this condition. Mr. Petsche, who was intimately familiar with the saw used on October 11th, testified that the saw shown in C-3, the guard in C-4, and blade in C-5 "looks like" those used on October 11th (Tr. 117). Also, Mr. Clark, who had observed the saw and blade used on

October 11th, testified that the saw in C-3 "looks identical" to the saw used on October 11th, and that the blade in C-5 "looks like the same blade". He also testified that the saw blade was in fragments after the October 11th accident (Tr. 140-141). Based on this testimony, and absent any contradictory evidence, the relevancy of Exhibits C-3 through C-7 was satisfactorily established, and Howard's motion to strike these exhibits is denied. Even if "looks identical" and "looks like the same" were deemed insufficent to establish that the saw, guard and blade shown in C-3 through C-7 were involved in the October 11th accident, the exhibits still would be admissible as illustrative of Mr. Petsche's and Mr. Clark's testimony.

A different ruling, however, is required for Exhibit C-8. As previously noted, the relevancy of Exhibit C-8 rested in the first instance on whether the saw in C-3 was AEG model WSD 2300S. The Secretary laid an appropriate preliminary foundation by establishing that the witness Blood through personal observation had personal knowledge that the saw in C-3 was the same as WSD 2300S (Tr. 71). On questioning by the Judge and cross-examination by Howard's counsel, however, it was brought out that no model number was distinguishable on the saw shown in C-3, that Mr. Blood's knowledge of the model number was obtained solely from what he was told by the owner of the saw, and that Mr. Blood did not personally know whether the saw in C-3 was a 1978 model (Tr. 73, 77). Due to Mr. Blood's proven lack of knowledge, his testimony that the saw in C-3 is the same model as shown in Exhibit C-8 must be stricken. Without any other evidence to establish this fact, Exhibit C-8 and any testimony of witness Blood concerning Exhibit C-8 also must be stricken for the Secretary's failure to establish Exhibit C-8's relevance.

## The Alleged Violations

### A. Citation No. 1 - Section 5(a)(1)

To establish that an employer has violated Section 5(a)(1), the Secretary must prove by a preponderance of the evidence: (1) that a hazard likely to cause death or serious bodily harm existed at the employer's workplace; (2) that the hazard was recognized as such either by that employer or generally within the industry, and (3) that there was a feasible method by which the employer could have abated the "recognized hazard." National Realty and Construction Company, Inc. v. O.S.H.R.C., 489 F.2d 1257 (D. C. Cir. 1973); Usery v. Marquette Cement Manufacturing Co., 568 F.2d 902 (2d Cir. 1977); Baroid Division of NL Industries, Inc., 660 F.2d 439 (10th Cir. 1981).

Asked at the hearing to state the Secretary's theory of liability the Secretary's counsel indicated that the alleged recognized hazard was that an ". . . oversize blade was being used on a saw for which it was too large to be used" (Tr. 89).

Having identified the alleged recognized hazard, the burden was on the Secretary to prove by a preponderance of evidence that the use of the abrasive wheel installed by Howard on the borrowed AEG cut-off machine was hazardous due to the size of the blade.

Many of the relevant facts surrounding the fatal accident of October 11, 1979, are undisputed.

Approximately a week or 4 days before October 11, 1979, Howard's project manager and superintendent at the Eisenhower Tunnel work site, Mr. Stan Plucheck, instructed Mr. Herb Petsche, a Howard foreman, to proceed with the drilling of an opening in a concrete wall in the west ventilation

building into which a camera housing was to be installed by Howard. Previously, in August, Mr. Petsche, on instructions of Mr. Plucheck, had drilled through the wall and had determined it to be five inches thick (Tr. 98).

Mr. Plucheck provided Mr. Petsche with an AEG abrasive cut-off machine with a blade already installed. Mr. Petsche, in turn, gave the cut-off machine to Mr. John Riggs and told him to cut an opening in the wall. A short time later, Mr. Riggs returned and told Mr. Petsche that the blade was unable to "score" the concrete and showed him that the blade had worn down "to hardly anything" (Tr. 102).

Mr. Petsche then called Mr. Plucheck on the phone and advised him that the blade". . . wouldn't even touch the concrete and we just wore the blade down."

On October 10, Mr. Plucheck called Mr. Petsche and asked him, ". . .[W]hat's the maximum size we can put in that machine?" Mr. Petsche, in response, told Mr. Plucheck that the maximum size was 14 inches (Tr. 103). When Mr. Petsche arrived at work the next day there was a "new metal blade" on the machine. It was 14 inches in diameter (Tr. 118). Mr. Plucheck said, "Let's go ahead and cut that thing, we can still make money if we get it cut tonight" (Tr. 103). During the evening of Wednesday, October 10, John Riggs and Steve Romer, on the instructions of Mr. Petsche and with the cut-off machine and blade provided by Mr. Plucheck, started cutting the opening. They could only cut into the wall four and a half inches deep. They needed to cut five inches deep (Tr. 104).

Mr. Petsche believed that the opening could be completed by cutting the remainder of the opening from the outside of the wall (Tr. 104-105).

Mr. Petsche made preliminary arrangements to hire Weaver Construction's manlift at $55.00 an hour. This manlift would enable Howard employees to cut the opening from the outside (Tr. 105).

Early on the morning of Thursday, October 11, Mr. Petsche arrived at the work site. He told Mr. Plucheck that Weaver had a manlift that would permit them to cut the opening from the outside.

Mr. Plucheck, complaining about the level of the cut, said he wanted to go look at the cut again and left the trailer to go to the ventilation room. Later he met Mr. Petsche and told him that the opening was "out of square" and "you ought to get on them guys" (Tr. 108).

Back at the trailer, Mr. Plucheck told Mr. Petsche, "We don't need it (manlift) . . . Use that blade over there" (Tr. 112, 126-127). Because Mr. Petsche was under the mistaken impression the new blade was the same size, he attempted to explain to Mr. Plucheck that it was the flanges holding the blade that were preventing a deeper cut, not the size of the blade (Tr. 112). Mr. Plucheck responded, "Just take off the guard, it's a bigger blade, and it will cut that half-inch" (Tr. 113).

Mr. Plucheck helped Mr. Petsche remove the blade guard (Tr. 115-116). After Mr. Petsche put on the new blade, he left the Howard trailer to find someone to finish cutting the opening. He found Steve Romer. Mr. Petsche and Mr. Romer then went to the ventilation room. Mr. Romer plugged in the cut-off machine and turned it on (Tr. 120). When he touched the blade to the concrete, the blade shattered, cutting Mr. Romer fatally[4/] (Tr. 120, 129).

4/ Mr. Clark's description of Mr. Romer's injuries (Tr. 139-140) and the characterization, "fatality investigation" support the conclusion that Mr. Romer died.

To prove his theory that the use of the particular blade was hazardous due to its size and so recognized as hazardous by the construction industry, the Secretary relied on the manufacturer's specifications for an AEG abrasive cut-off machine, model No. WSD 2300S (Exhibit C-8), Mr. Blood's opinion that use of the 16-inch abrasive blade on the AEG cut-off machine on October 11 was hazardous (Tr. 62-69, 72), and Mr. Blood's testimony that industry recognizes that the blade shown in Exhibit C-7 (and used on October 11) was "too large to use on that particular saw (Tr. 72-73).

Although Mr. Blood's referenced opinions were admitted into evidence over Howard's objection of "competency" (Tr. 63-64, 72-73), they will not be credited or given any weight. Mr. Blood acknowledged he was not an expert on abrasive blades generally, nor an expert on the blade involved in the October 11 accident in particular. (Tr. 56, 58, 77-78). Further, his opinion in regard to the alleged size hazard is not based on personal perception or experience. Rather, his opinion in this regard is based solely on the manufacturer's specification in Exhibit C-8 that the "Max. Wheel Diameter" of AEG's 1978 model WSD 2300S cut-off machine is 14 inches, what he was told by an unidentified spokesman of the manufacturer, and the ANSI standard, B7.1-1970.

Exhibit C-8, of course, has been stricken for failure of the Secretary to establish its relevancy to this proceeding. As previously pointed out, Mr. Blood, the only foundation witness for Exhibit C-8, lacked personal knowledge that the AEG cut-off machine shown in Exhibit C-3 was a 1978 model WSD 2300S. But even if Exhibit C-8 is relevant and, therefore, admissible, it falls short of proving what the Secretary claims it does. The manufacturer's catalogue fails to explain what happens if an abrasive wheel or blade larger than 14 inches is used. And on this record, it is

just as reasonable to conclude that a maximum wheel diameter of 14 inches has been prescribed by the manufacturer because the cut-off machine's designed guard cannot accommodate a larger diameter wheel. Whether use of an unguarded abrasive blade on a cutting-off machine is a violation of the Act, of course, is the central issue of Citation No. 2, not Citation No. 1.

With respect to Mr. Blood's reliance on provisions of ANSI standard B7.1-1970, he never identified the provisions which supported his opinions, thereby making it impossible to evaluate their worth. Even the Secretary's counsel was unable to assist in this regard, and conceded he was not relying on an ANSI standard to support his theory of liability (Tr. 68).

The statements of the manufacturer's unidentified spokesman to Mr. Blood are hearsay. But more importantly, these statements are relevant only if the evidence establishes that a 1978 model WSD 2300S was the cut-off machine used in the October 11 cutting. For the same reasons that Exhibit C-8 was struck, any statements made by the manufacturer with respect to that model also must be disregarded. Moreover, even if a sufficient foundation had been laid to establish the relevance of the statements, this Judge would give them no weight because they are uncorroborated hearsay on a critical issue.

For the above reasons, the Secretary has failed to prove by a preponderance of evidence that the use of the 16-inch diameter blade on October 11 was hazardous due to the blade's size, or that either the construction industry or Howard recognizes such a use as hazardous. Absent this proof, Citation No. 1 must be vacated.

B. Citation No. 2 - 29 C.F.R. §1926.303(b)

Howard first argues that the standard at issue in Citation No. 2 is inapplicable because the cut-off machine used by Howard on October 11 is not a "grinding machine." This Judge disagrees and finds the standard applicable to the facts of this case.

Standard 29 C.F.R. §1926.303 is entitled, "Abrasive Wheels and Tools". All of the specific provisions of this section relate and refer to machines used for grinding or abrasive wheels or blades used to grind.

Section 1926.303(b) requires that grinding machines shall be equipped with safety guards in conformance with ANSI standard B7.1-1970, Safety Code for the Use, Care and Protection of Abrasive Wheels. As pointed out by the Secretary in his brief, the "scope" section of this ANSI standard (§1.1) provides that "[t]his code sets forth the rules and requirements for safety on the use of abrasive wheels. . ." and Section 1.2.2 of this same standard defines an abrasive wheel as a "cutting tool. . .".

Because the ANSI standard covers and relates to "grinding" machines which use abrasive ("cutting") wheels, as well as to "cutting-off" machines which use abrasive ("grinding") wheels (See §4.3.3), it seems obvious that the ANSI standard's provisions are intended to apply regardless of whether the abrasive wheel is used to "grind" or "cut." Clearly, the adjectives "cutting" and "grinding" are used interchangeably and are equivalent in meaning wherever found in the ANSI standard.

By referencing in §1926.303(b), §1926.303(d), which requires that all abrasive wheels and tools meet "other applicable" requirements of

ANSI standard B7.1-1970, the Secretary plainly indicated his intent to incorporate into §1926.303(b) all of the applicable guarding requirements of B.71-1970. Because B7.1-1970 specifically requires a cutting-off machine to be guarded, so does §1926.303(b). To read and interpret §1926.303(b) as not requiring guarding on abrasive wheel, cutting-off machines would fly in the face of reason and ignore the plain intent of the Secretary.

The evidence establishing a violation of §1926.303(b) is overwhelming. Section 3.2 of ANSI standard B7.1-1970 requires that grinding machines (also cutting-off machines) "shall" be equipped with safety guards in conformance with section 4. Section 4.1 provides that all abrasive wheels (with some designated exceptions, not applicable in this case) shall be used only on machines provided with safety guards. The following paragraphs of section 4 then describe the type of guards that must be used on particular wheels and machines. Section 4.3.3 prescribes the maximum angular exposure of the "grinding wheel" periphery and sides for the safety guards used on "cutting-off" machines.

The AEG abrasive cutting-off machine used by a Howard employee on October 17, 1979, was equipped with a safety guard. Howard's superintendent, however, ordered the guard removed and assisted in the guard's removal. He also provided and ordered the Howard foreman to install on the AEG cutting-off machine an abrasive wheel measuring approximately 16 inches in diameter. He knew the guard could not be reinstalled due to the wheel's size and knew this abrasive wheel was marked with the instruction "USE GUARD" (Tr. 56, Ex. C-5). Howard's superintendent then assigned Howard's foreman, Mr. Petsche, the task of completing the

cut in the concrete wall and instructed him how the cut should be made. The foreman asked Steve Romer, the Howard employee who had previously assisted in cutting the opening, to finish the cut.

The instant the abrasive wheel contacted the concrete it shattered, striking and fatally injuring Mr. Romer. The moment Mr. Romer attempted to cut the opening with a cutting-off machine unequipped with a safety guard, he committed a violation of §1926.303(b). The violation obviously was the direct result of Mr. Plucheck's orders. He removed the guard and gave the instructions to use the unguarded cutting-off machine.

Howard argues that, even assuming a violation, Howard cannot be held responsible or liable because there is no evidence that Howard knew of any dangerous condition or that it could have foreseen or prevented the same. Howard's contention is totally without merit. Contrary to Howard's view of the facts, the violation by Mr. Romer in this case was not an isolated incident of unforeseeable or idiosyncratic employee behavior. As previously pointed out, it was the direct result of the actions and orders of Howard's superintendent. Mr. Plucheck not only knew that the unguarded cutting machine was going to be used, he ordered its use.

Howard cites Mountain States Tel. & Tel. Co. v. Occupational Safety and Health Review Com., 623 F.2d 155 (10th Cir. 1980) in support of its claim that knowledge of any violation of §1926.303(b) "cannot be imputed" to the respondent. Howard's reliance on Mountain States Tel. & Tel. Co., however, is misplaced. Actually, the court's holding there supports the opposite conclusion. In that case, the court stated:

> "When a corporate employer entrusts to a supervisory employee its duty to assure employee compliance with safety standards, it is reasonable to charge the employer with the supervisor's knowledge--actual or constructive--of noncomplying conduct of a subordinate. Upon a showing of the supervisor's knowledge, it is not unreasonable to require the employer to defend by showing the failure to prevent violations by subordinates was unforeseeable."

Here, Howard's highest ranking supervisor at the work site knew that an employee was going to use an unguarded cutting-off machine. Not only did he fail to take steps to prevent the machine's use, he ordered it used in an unguarded condition. On these facts, the holding in Mountain States Tel. & Tel. Co. requires imputation of the supervisor's knowledge to Howard.

For similar reasons, the violation of §1926.303(b) is found to be "willful."

The Commission has found a violation to be willful when it is marked by careless disregard of a standard or of employee safety. According to the Commission, once careless disregard of employee safety has been established, the Secretary need not prove additionally that an employer knew that it was violating the Act. See John W. Eshelman and Sons Steel Erectors, Inc., 81 OSAHRC 18/D2, 9 BNA OSHC 1396, 1981 CCH OSHD ¶22,264, 25,231 (No. 76-5039, 1981).

Applying this test, Howard's violation obviously was willful. Howard's superintendent deliberately removed the guard despite the instruction on the abrasive wheel to "USE GUARD" and the urging of Foreman Petsche not to remove the guard (Tr. 138). Certainly, the superintendent's actions in this case demonstrate a blatant indifference to employee safety and, therefore, constitute "willful" conduct.

The proposed penalty of $8,000.00 also will be assessed. Based upon the criteria enumerated in section 17(j) of the Act, a substantial penalty is warranted. Howard employs 600 persons and cannot be classified as a small employer. Howard also has a past history of violations under the Act and apparently maintained no safety program at the Eisenhower Tunnel work site (Tr. 122, 141). Further, the violation was of the highest gravity. Finally, the deliberate exposure of an employee to a life-threatening hazard precludes any credit for good faith. On these facts, and in order to encourage Howard to imbue safety consciousness in its supervisors, the proposed penalty of $8,000 will be assessed.

## Findings of Fact

All findings of fact relevant and necessary to a determination of the contested issues have been found specifically and appear above. (See, Rule 52(a) of Federal Rules of Civil Procedure.) Proposed findings of fact inconsistent with this decision are denied.

## Conclusions of Law

1. The record establishes by a preponderance of the evidence that respondent committed a "willful" violation of 29 C.F.R. §1926.303(b), on October 11, 1979, with respect to its use of an unguarded abrasive AEG cutting-off machine.

2. A penalty of $8,000.00 for respondent's violation of 29 C.F.R. §1926.303(b) is appropriate.

3. Complainant has not shown by a preponderance of the evidence that use of an abrasive wheel measuring approximately 16 inches in diameter on October 11, 1979, was hazardous due to its size; or that the use of a wheel of that size constitutes a "recognized hazard", as those terms are used in

29 U.S.C. §654(a)(11). Therefore, complainant has not proven that respondent violated 29 U.S.C. 654(a)(1) as alleged in Citation No. 1, issued April 1, 1980.

## ORDER

Based upon the Findings of Fact, Conclusions of Law, and the entire record, it is ORDERED:

1. Citation No. 1, issued April 1, 1980, is VACATED.

2. Citation No. 2, issued April 1, 1980, is AFFIRMED, and a penalty of $8,000.00 ASSESSED.

| BASF WYANDOTTE CORPORATION, | : | |
| Respondent, | : | |
| OIL, CHEMICAL, & ATOMIC WORKERS INTERNATIONAL UNION, AFL-CIO-CLC LOCAL 4-620, | : | |
| Authorized Employee Respresentative. | : | |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE Commissioners.

BY THE COMMISSION:

This case is before the Commission on interlocutory appeal[1/] of Administrative Law Judge Joe D. Sparks' order disapproving a settlement between the Secretary of Labor and Respondent, BASF Wyandotte Corporation ("BASF"). The Oil, Chemical and Atomic Workers International Union, Local 4-620 ("the Union"), an authorized employee representative, objected to the settlement, claiming that the settlement would not abate the principal hazard in this case. Judge Sparks held that the settlement agreement could not be approved because it allowed an item of the citation to be withdrawn without affording the Union an opportunity to be heard on the merits. We reverse Judge Sparks' deci-

1/ See Commission Rule 75, 29 C.F.R. § 2200.75.

sion and remand for specific findings on whether the settlement is consistent with the provisions and objectives of the Act.

I

At BASF's chemical production plant, chlorine gas is produced by an electrolytic process in devices referred to as chlorine cells. The chlorine cells, which are approximately five feet high, three feet wide and about ten feet long, are set in long rows with catwalks running between the rows to provide workers access to the cells. The cells, which contain exposed, energized electrical parts, are located in two huge rooms with each room containing 156 cells. While in the cell room, the employees are protected against electric shock by rubber gloves and boots. Warning signs are posted on the doors of the cell rooms and the rooms are restricted to authorized personnel.

On September 18, 1978 John Courtney, a BASF employee, was accidentally electrocuted. There were no eyewitnesses to the incident, but apparently Courtney stepped into a 4-1/4 inch by 16-1/2 inch floor hole beside the step leading to an elevated catwalk in the chlorine cell room, lost his balance, tumbled from the narrow elevated catwalk and came in contact with the live portion of a chlorine cell. Shortly after the incident, BASF repaired the floor hole. The decedent was a qualified cell room operator.

The Secretary issued a single citation alleging willful violations of 29 C.F.R. § 1910.23(a)(8) (a floor hole standard) and 29 C.F.R. § 1910.309(a), incorporating section 110-17(a) of the National Electric Code (the guarding of live electrical parts).

Shortly after the citation was issued, the Secretary and BASF engaged in settlement talks. The Secretary kept the Union up to date

with the settlement negotiations and the Union suggested employees the Secretary might depose for the case. The Union and BASF also engaged in unsuccessful settlement negotiations of their own. Eventually, BASF and the Secretary entered into a settlement agreement. BASF agreed to accept a serious violation of the floor hole standard and the Secretary agreed to withdraw the part of the citation concerned with BASF's alleged failure to guard live electrical parts.[2/] The Union objected to this settlement and a hearing was held on whether the settlement should be approved. In disapproving the agreement, Judge Sparks did not rely on any evidence presented at the hearing but held, as a matter of law, that a settlement agreement which withdraws an item of a citation cannot be approved over the objection of an employee party.

II

Recently, the Commission held that an employee party is entitled to be heard on any objection it has to a settlement agreement between the Secretary and the employer. Mobil Oil Corp., 82 OSAHRC , 10 BNA OSHC 1905, 1982 CCH OSHD ¶ 26,187 (No. 77-4386, 1982). The Commis-

---

2/ The Secretary offered to withdraw the second citation because the facts seemed to indicate that BASF was in compliance with the NEC. The pertinent portions of the NEC provide:

> 110-17. Guarding of Live Parts. (Not more than 600 Volts)
>
> (a) Except as elsewhere required or permitted by this Code, live parts of electrical equipment operating at 50 volts or more shall be guarded against accidental contact by approved cabinets or other forms of approved enclosures, or any of the following means:
>
> (1) By location in a room, vault, or similar enclosure which is accessible only to qualified persons.

The cell rooms had warning signs and were restricted to authorized personnel.

sion stated that the judge must hear the objections of an employee party in order to determine if the settlement agreement is consistent with the provisions and objectives of the Act. See Mobil Oil, supra, and Commission Rule of Procedure 100, 29 C.F.R. § 2200.100.

The overriding purpose of the Act is the elimination of conditions hazardous to employees. In general, a settlement agreement that leaves a serious hazard uncorrected will not be consistent with this objective and should not be approved. Mobil Oil Corp., supra. In this case, the crux of the Union's objection is that the settlement agreement, by deleting the item involving unguarded electrical parts, leaves uncorrected the electrocution hazard that has already proven fatal to one employee.

If the judge determines that the Union's objections have merit, and the settlement agreement is inconsistent with the purpose of the Act, then the judge should disapprove the settlement. Since Judge Sparks made no specific findings concerning the merits of the Union's objections, the case must be remanded for such findings.[3/] If the judge

---

3/ In determining whether the Union's objection has merit, the judge must consider several factors. He must first decide whether the conditions at BASF's workplace, which will remain unabated if the settlement agreement is approved, are in fact hazardous to employees. If so, he must inquire into whether there exists a statutory basis for requiring the abatement of the hazard. In this case, the Union does not contend that BASF violated the electrical standard cited by the Secretary, but argues that BASF violated section 5(a)(1) of the Act. In determining whether the case should proceed on the merits, the judge must determine whether amendment to a section 5(a)(1) charge is appropriate.

Section 5(a)(1), 29 U.S.C. § 654(a)(1), provides:

> Sec. 5.(a) Each employer —
>
> (1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees.

disapproves the agreement, the case should proceed on the merits.[4/]

The case is remanded to Judge Sparks for specific findings on the Union's objections and for further proceedings as necessary.[5/] SO ORDERED.[6/]

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: DEC 7 1982

---

4/ Commissioner Cleary would have the judge approve the settlement only if he concludes that the Union's objections are without merit as a matter of law. If the judge finds merit in the objections, he should deny the Secretary's motion and schedule the case for a hearing. If the Secretary does not appear at the hearing to prosecute the citation, the judge should permit the Union to prosecute if it chooses to do so. Cuyahoga Valley Railway Co., 82 OSHARC , 10 BNA OSHC 2156, 1982 CCH OSHD ¶ 26,296, (No. 76-1188, 1982) (concurring opinion). Commissioner Cottine presumes that the Secretary will proceed appropriately on the merits if the settlement agreement is disapproved. Mobil Oil Corp., 10 BNA OSHC at 1916 n. 30, 1982 CCH OSHD at p. 33,030 n. 30; see Dunlop v. Bachowski, 421 U.S. 560, 574-6 (1975).

5/ Since Judge Sparks has already held a hearing concerning whether the settlement agreement should be approved, it may not be necessary to request any further evidence. Should Judge Sparks determine that more evidence is needed, the Commission would encourage the use of less formal means of fact finding such as depositions and affidavits.

6/ Chairman Rowland adheres to his position in Mobil Oil Corp., supra (dissenting opinion), and in Cuyahoga Valley Railway Co., supra note 4, 10 BNA OSHC at 2158 n. 5, 1982 CCH OSHD at p. 33,229 n. 5. The Chairman believes that except where the abatement date is an issue, the terms of a settlement agreement lie within the prosecutorial discretion of the Secretary. Hence, the withdrawal of a citation in a settlement by the Secretary is not subject to review by the Commission. Chairman Rowland notes further that in this case remand to the judge is particularly inappropriate since the judge concluded that but for the objection of the union, the agreement would have been approved as consistent with the objectives of the Act.

## ORDER CERTIFYING INTERLOCULATORY APPEAL

A Settlement Agreement, executed by the complainant and respondent, was received September 28, 1979 (J-26). On October 2, 1979, Mr. Steven Wodka, International Representative of the captioned union, formally stated its objections to the settlement agreement (J-30).

A hearing was held in Baton Rouge, Louisiana, on October 23, 1979, to hear testimony and argument on the issue of whether the settlement agreement should be approved.

An Order entered December 5, 1979, ruled that the settlement agreement could not be approved since it provided for the withdrawal of one alleged violation over the objections of the union. It thereby denied the union an opportunity to be heard on the merits and was held to conflict with the rationale of IMC Chemical Group, Inc., 78 OSHRC 95/C14, 6 BNA OSHC 2075, 1978 CCH OSHD ¶23,149 (Docket No. 76-4761). Except for the objections by the union, the settlement agreement would have been approved as consistent with the objectives of the Act

15

and in conformity with Dawson Brothers Mechanical Contrators, 72 OSHRC 5/B8(1/386), 1 BNA OSHC 1024, 1971-73 CCH OSHD ¶15,039 (Docket No. 12, 1972).

Complainant and respondent moved for an order certifying the ruling for an interlocutory appeal.

Pursuant to Commission Rule 75 I find and certify that:

(1) the ruling involves an important question of law concerning which there is substantial ground for difference of opinion; and

(2) an immediate appeal from the ruling will materially expediate the proceedings.

Accordingly, the motion is granted and the Interlocutory Appeal is hereby certified.

Dated this 19th day of December 1979.

# OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

## NOTICE OF DECISION

Secretary of Labor v. WAUPACA FOUNDRY, INC.
OSHRC Docket No. 81-1543, 81-1749 & 81-1750

1. Enclosed is a copy of my decision. It will be filed with the Commission on November 15, 1982, and will become the final order of the Commission on December 15, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is December 15, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

Richard J. Murphy
Judge, OSHRC

## DECISION AND ORDER

Murphy, Judge

Respondent, Waupaca Foundry, Inc., (Waupaca) operates grey iron foundries at Marinette and Waupaca, Wisconsin. On April 28, 1981, a compliance officer of the Occupational Safety and Health Administration (OSHA) made an inspection of the Marinette plant and on May 13, 1981, inspected Respondent's Plants 1, 2 and 3 in Waupaca.

As a result of these inspections Respondent was issued citations which became the subjects of the complaints in this proceeding. Docket No. 81-1543 is the complaint concerning the Marinette plant. Docket No. 81-1749 concerns Plants 2 and 3 at Waupaca, and Docket No. 81-1750 concerns Plant 1 at Waupaca. Each complaint alleges numerous violations of the Occupational Safety and Health Act of 1970 (29 U.S.C.651 et seq) (Act) as described in several multi-item citations. The parties have settled most of the issues raised by the complaints[1/] and have filed a partial settlement agreement in each case. Those agreements, dated August 16, 1982, have been posted as required by Rules 7 and 100 of the Commission's Rules of Procedure, 29 CFR 2200. No objections to those settlement agreements has been made by or on behalf of Respondent's employees. Those agreements are approved.

As a result of the amendments to the pleadings made by the partial settlement agreements the only contested issues presented for disposition are whether Respondent violated Section 5(a)(2) of the Act by failing to guard portable hand held grinders used in its Marinette and Waupaca foundries[2/] as required by 29 CFR 1910.243(c)(1). That safety standard, with limited exceptions, provides that portable abrasive wheels shall be used for exterior grinding only on machines provided with safety guards.

---

1/ Respondent admitted that had employees at workplaces at its Marinette and Waupaca foundries and that it was engaged in a business affecting commerce within the meaning of Section 3(5) of the Act. It is found and concluded that this Commission has jurisdiction in this case under Section 10(a) of the Act.

2/ Item 4 of Citation 1 in Docket No. 81-1543(Marinette Plant); Item 7 of Citation 1 in Docket No. 81-1749 (Waupaca Plants 2 and 3); and Item 4 of Citation 1 in Docket No. 81-1750 (Waupaca Plant 1) contain the only disputed allegations of unlawfulness.

## COMPLAINANT'S CASE

The inspections that resulted in the instant complaints were made by Gordon C. Krohn, an OSHA compliance officer. Mr. Krohn testified that during the course of those inspections he observed grinding performed on external surfaces of castings by hand held grinders which did not have guards on the abrasive wheels. Complainant's Exhibits 2 (Marinette Plant); 4 (Waupaca Plant 1); and 5, 6, 7, and 9 (Waupaca Plants 2 and 3) are photographs taken by Mr. Krohn during the course of his inspections which show employees operating unguarded hand held grinders on external surfaces. Complainant's Exhibits 3 (Waupaca Plant 1) and 8 (Waupaca Plants 2 and 3) are photographs also taken by Mr. Krohn which show unguarded portable grinders available for use at locations other than those depicted in Complainant's Exhibits 2, 4, 5, 6, 7 and 9.

The unguarded grinding wheel depicted in Complainant's Exhibit 8 bears the warning that it should not be used without a guard. Also Complainant's Exhibits 11 and 12 which are reproductions of portions of catalogues of Chicago Pneumatic and Ingersoll-Rand, two major manufacturers of portable hand operated grinders, stress the importance of guarding. The Ingersoll-Rand grinder features an integrated guard which prevents tool operation when the guard is removed. The Chicago Pneumatic catalogue refers to the American National Standard Institute safety code which specifies the guarding requirement.

In the opinion of Mr. Krohn the hazard to the employee operating an unguarded grinder or to other employees in the area is the hazard of deep puncture wounds, potential amputation, loss of sight and possibly death if a wheel fragment should puncture a vital organ. The injuries would be caused by shattering of an abrasive wheel or by accidental contact with a wheel. Mr. Krohn had personal knowledge of a severe leg injury and loss of an eye as a result of grinding wheel explosions.

The fact that hand held portable grinders without guards were used for grinding external surfaces is established by testimony of Mr. Krohn and the photographs he took during the inspections. Employee access to the hazard is proven by those pictures which show employees holding the grinders during the grinding process. The seriousness of the injuries that could occur from fracture or explosion of an unguarded grinding wheel is established by witness Krohn's testimony. Respondent had actual knowledge of the fact that its grinders were operated without a guard.

In Hermitage Concrete Pipe Co., 10 OSHC 1517 (1982), the Commission stated the requirements of Section 17(k) as follows:

> ". . . In order to establish a serious violation of the Act, the Secretary must establish that (1) death or serious physical harm could result if the standard is violated, and (2) that the employer has actual or constructive knowledge of the violative condition.(1518)."

I find that in each case here Complainant has made a prima facie showing that Respondent failed to comply with 29 CFR 1910.243(c)(1). That failure is a serious violation of the Act under the criteria of the Hermitage case and as defined in Section 17(k) of the Act.

## Respondent's Defense

At the hearing Respondent did not contest the fact that its portable hand held grinders were unguarded and neither at the hearing nor on brief did Respondent contend that the unguarded grinders specified in the complainants are in compliance with 29 CFR 1910.243(c)(1). Rather Waupaca's defense is based on two independent theories. First, Respondent argues that its violation, if any, is de minimus for the reason that because of the safety measures in effect at Waupaca's foundries the failure to guard the portable grinders has only a negligible relationship to employee safety. Second, Respondent advances the affirmative defense of impossibility of compliance arguing that due to the nature of the castings being ground it is impossible to guard the portable grinders and still perform the necessary work.

## The De Minimus Defense

Respondents cites the well established principle that where a violation has only a negligible or trifling relationship to employee safety the Commission may classify the violation as de minimus and neither assess a penalty nor order abatement [3/] and refers to cases in which the Commission

3/ Continental Oil Company, 7 OSHC 1432, 1433(1979); Alton Box Board Company, 9 OSHC 1846, 1847(1981); General Motors Corporation, 9 OSHC 1575, 1577(1981); Clifford B. Hannay & Son, Inc., 6 OSHC 1335, 1337(1978); National Rolling Mills Company. 4 OSHC 1719, 1720(1976).

regarded practices in employer's plants sufficient to eliminate hazard and therefore justify a de minimus holding.[4/]

In its necessary effort to show that the failure to guard its portable hand held grinding wheels had no appreciable effect on employee safety Respondent relies on its safety record and on its safety practices.

Respondent presented Greg Marvelas, its safety director, who testified that Respondent has a relatively low injury rate, being fifty or sixty percent of the grey iron foundry industry average, and that its injury experience is reflected in favorable workmans compensation insurance rates. Waupaca maintains a log of injuries. That log does not list any injuries caused by a shattering grinding wheel since 1971 when the record was initiated.

Mr. Marvelas also described Waupaca's practices in handling the grinding wheels. Mr. Marvelas recognizes that a grinding wheel could shatter in use if it were flawed, damaged in handling or in use, improperly mounted on the grinder, or mounted on a grinder with a faster RPM than that for which the abrasive stone was designed. Mr. Marvelas described the inspection, handling, storage and testing procedures employed by Respondent to prevent use of defective abrasive wheels which would be likely to explode. Ronald L. Pagel, Production Foreman of Respondent's Plant 2 Mill Room, described the safety training and safety practices in his department.

---

4/ National Rolling Mills Company, supra N3; Ray Boyd Plaster & Tile, Inc., 6 OSHC 1648, 1653, (1978); Southwestern Electric Power Company, 8 OSHC 1974, (1980).

While it appears from the testimony of Respondent's witnesses Marvelas and Pagel in regard to Respondent's work practices and from Respondent's safety record that Respondent is concerned about safety and sincerely works to provide a safe workplace, the record does not show that the failure to comply with the guarding requirement of 29 CFR 1910.243(c)(1), has an insignificant or de minimus effect on employee safety.

The absence of serious accidents caused by unguarded portable grinders, while perhaps a sine qua non for a de minimus finding (see Continental Oil Company, supra), does not establish the absense of the hazard. A. E. Burgess Leather Company, Inc. 5 OSHC 1096(1977), sustained 576 F 2d 948 (1st Cir. 1978). A hazard requiring abatement may exist in the absense of recorded injuries, Arkansas-Best Freight Systems, Inc., 529 F2d 649 (8th Cir. 1976). One of the purposes of the Act is to prevent the first accident.

Also Respondent's procedure for handling and testing grinding wheels before using them is the type of practice required by 29 CFR 1910.243(c)(5) which sets forth the safety standard for mounting and inspection of abrasive wheels. The standards require that abrasive grinding wheels be inspected and be installed properly on portable hand held grinders to minimize the possibility of wheel explosion or shattering while in operation; and as a further safety measure require that the grinding wheels be guarded to protect employees in the event that in spite of inspection and proper installation a wheel should shatter or explode. In view of the seriousness

of the injury that could result from such an incident and the possibility of an accident in spite of the care exercised by Respondent[5/] I find that the presence of guards on the portable grinders in Respondent's foundries would have more than a trifling, unsubstantial or de minimus effect on employee safety.

For these reasons I hold that this is not a case in which the failure to comply with the standard can be characterized as a de minimus omission.

## The Impossibility Defense

Respondent's evidence in support of its affirmative defense of impossibility of compliance is submitted through the testimony of Mr. Marvelas, and Mr. Pagel. Mr. Pagel's testimony relates exclusively to the grinding operations in his department and Mr. Marvelas, while specific in respect to Plant 2 Mill Room, only described in most general terms the grinding operations in other plants. The Exhibits introduced by Respondent on the impossibility issue (Respondent's Exhibits 1 through 14) are of castings, a grinder, and operations in the Plant 2 Mill Room. On brief respondent states that the grinding practices at each plant differ according to the type of castings produced in each plant (P3). In view of that statement the evidence submitted in support of its impossibility of compliance defense for Plant 2 Mill Room can not be considered as applicable to other operations. Therefore, I find that Respondent has not met its burden of proof on this affirmative deference

5/ Grinding wheels have shattered at Waupaca Plants in the past (Tr 109A).

in respect to the Marinette Plant (Docket No. 81-1543); Waupaca Plant 1 (Docket No. 81-1750); and Waupaca Plant 3 (one of the Plants in Docket No. 81-1749).[6/]

The remaining issue on this defense is whether the evidence submitted by respondent validates its impossibility of compliance defense for Plant 2 Mill Room. In order to establish the defense, an employer must show that (1) compliance with the standard, i.e., in this case guarding of portable grinders, would preclude performance of required work and (2) that the employer used reasonable alternative means to protect its employees. M. J. Lee Construction Co., 7 OSHC 1140, 1144-46 (1979).

Plant 2 produces castings which range from 60 pounds to 300 pounds with the most typical size being from 100 to 200 pounds. (Tr. 91) Virtually all casting grinding in Plant 2 Mill Room is performed by portable cup grinders. ( Tr. 117) These grinders are used to grind the internal cavity of the casting and also to grind the outside of the castings. 98 percent of the grinding at Plant 2 is done with portable cup grinders of which 45 to 50 percent is external (Tr. 117) Portable cup grinders are the type of grinder which the standard, 29 CFR 1910.243(c)(1), requires be guarded if used for external grinding.

The two castings shown in Respondent's Exhibits 1 and 2 are produced in Plant 2. They weigh 121 and 118 pounds respectively. (Tr. 121). The casting shown in Respondent's Exhibit 1 is the casting shown in

6/ On reply brief (Fn P 6) Respondent limited its reliance on the impossibility defense to production operations in the Mill Rooms of its plants 1, 2 and 3 at Waupaca.

Respondent's Exhibits 3 through 10. The casting shown in Respondent's Exhibits 12, 13 and 14 is the same type as the casting shown in Exhibits 3 through 10.

Mr. Marvelas testified that unguarded cup grinders are used on the outside of castings for the reason that the entire periphery of the casting can be ground in one motion as compared to several if a guard is used (Tr 94) Respondent's Exhibits 3 through 8 show the continuous motion of grinding the periphery of the casting with an unguarded tool. Respondent's Exhibits 9 and 10 show internal grinding being done with the same tool. Mr. Marvelas discussed Respondent's Exhibits 12 and 13 and stated that they depict the same employee attempting to grind the outside periphery of the casting with a guarded portable cup grinder and that No. 14 depicts the employee attempting internal grinding of the casting with the same guarded tool. Mr. Pagel also reviewed these exhibits and expressed the opinion that employees in his department could not grind the castings with guards on the portable grinders.

The weakness of Respondent's evidence on this defense is that at best it shows that Respondent may have to change its grinding procedures on one type of casting.[7/] The regulation does not require respondent to guard portable grinders used for internal grinding. Respondent may be required to supply two grinders for its employees, one for internal and one for external grinding, as guards are not required on grinders used for internal grinding.

---

7/ Respondent did not submit evidence to show that external grinding could not be done with guarded grinders on the type of casting shown in Complainant's Exhibit 6 which was produced in the Plant 2 Mill Room (Tr. 44).

In summary, Respondent limited its evidence on its impossibility of compliance defense to one of the four foundries involved here and submitted evidence as to the impossibility of using a guarded grinder for grinding external surfaces of only one of the types of castings produced at that plant. I find that Respondent has demonstrated that for one of the types of castings ground in the Plant 2 Mill Room compliance with the 29 CFR 1910.243(c)(1) requirement that grinding wheels be guarded when used on external surfaces may require Respondent to change its operations somewhat and therefore may inconvenience Respondent. However that showing of inconvenience is not tantamount to showing that guarding would preclude the performance of the required grinding of exterior surfaces of that type of casting. For these reasons I find that Respondent has failed to satisfy its burden of proof on its impossibility of compliance defense.

## Penalties

Complainant proposes penalties of $540.00 in Docket No. 81-1543; $730.00 in Docket No. 81-1749; and $630.00 in Docket No. 81-1750 for the violations of 29 CFR 1910.243(c)(1) discussed heretofore. Giving consideration to Respondent's safety practices and its good safety record along with the other criteria set forth in Section 17(j) of the Act, I find that the penalty should be reduced to $350.00 in each case.

## ORDER

The settlement agreements dated August 16, 1982, in Dockets Nos. 81-1543, 81-1749 and 81-1750 are approved; the request of the parties that the pleadings be amended to conform to those settlement agreements is granted; and the civil penalties to which the parties have agreed are imposed.

Item 4 of serious citation 1 in Docket No. 81-1543 is affirmed and a civil penalty of $350.00 is imposed.

Item 7 of serious citation 1 in Docket No. 81-1749 is affirmed and a civil penalty of $350.00 is imposed.

Item 4 of serious citation 1 in Docket No. 81-1750 is affirmed and a civil penalty of $350.00 is imposed.

DECISION

Before ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

The occupational noise standard at 29 C.F.R. § 1910.95(b)(1)[1/] requires that "feasible" administrative or engineering controls be implemented to reduce excessive noise levels. This case involves the meaning of the word "feasible" as it is used in the standard. In Continental Can Co., 76 OSAHRC 109/A2, 4 BNA OSHC 1541, 1976-77 CCH OSHD ¶ 21,009 (No.

---

1/ 29 C.F.R. § 1910.95(b)(1) provides:

§ 1910.95 Occupational noise exposure.

* * *

(b)(1) When employees are subjected to sound exceeding those listed in Table G-16, feasible administrative or engineering controls shall be utilized. If such controls fail to reduce sound levels within the levels of Table G-16, personal protective equipment shall be provided and used to reduce sound levels within the levels of the table.

* * *

(continued on next page)

3973, 1976), appeal withdrawn, No. 76-3229 (9th Cir. Apr. 26, 1977) ("Continental Can"), the Commission first interpreted "feasible" in the noise standard. A divided Commission held that the word must be interpreted "to effectuate the Congressional purposes underlying the Act,"[2/] 4 BNA OSHC at 1546, 1976-77 CCH OSHD at p. 25,255, and reasoned that this means a cost-benefit analysis is required. The Commission stated: "In determining whether controls are economically feasible, all relevant cost and benefit factors must be weighed." 4 BNA OSHC at 1547, 1976-77 CCH OSHD at p. 25,256.

---

1/ (continued)

TABLE G-16—PERMISSIBLE NOISE EXPOSURES[1]

| Duration per day, hours | Sound level dBA slow response |
|---|---|
| 8 | 90 |
| 6 | 92 |
| 4 | 95 |
| 3 | 97 |
| 2 | 100 |
| 1-1/2 | 102 |
| 1 | 105 |
| 1/2 | 110 |
| 1/4 or less | 115 |

[1] When the daily noise exposure is composed of two or more periods of noise exposure of different levels, their combined effect should be considered, rather than the individual effect of each. If the sum of the following fractions: $C_1/T_1 + C_2/T_2$ $C_n/T_n$ exceeds unity, then, the mixed exposure should be considered to exceed the limit value. $C_n$ indicates the total time of exposure at a specified noise level, and $T_n$ indicates the total time of exposure permitted at that level.

Exposure to impulsive or impact noise should not exceed 140 dBA peak sound pressure level.

2/ The Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act" or "the OSH Act").

This holding of Continental Can has remained Commission precedent. Samson Paper Bag Co., 80 OSAHRC 60/A2, 8 BNA OSHC 1515, 1980 CCH OSHD ¶ 24,555 (No. 76-222, 1980). However, the Supreme Court has since interpreted the word "feasible" in section 6(b)(5)[3/] of the Act and held that "feasible" does not require, and indeed precludes, a weighing of costs and benefits. American Textile Manufacturers Institute, Inc. v. Donovan, 101 S.Ct. 2478 (1981) ("ATMI"). The Court held that "feasible" means "capable of being done" or "achievable" and that Congress intended employee health to outweigh "all other considerations save those making the attainment of this 'benefit' unachievable." 101 S.Ct. at 2490.

In this case, we consider the impact of the Supreme Court's decision in ATMI on the Commission's interpretation of the noise standard in Continental Can. For the following reasons, we hold that the interpretation in Continental Can was erroneous.

I

Sun Ship, Inc. operates a shipyard in Chester, Pennsylvania. In September, 1975, a United States Department of Labor compliance officer inspected the plant and measured the noise to which one blacksmith was exposed during his work shift. Because the compliance officer found excessive noise exposure, Sun Ship received a citation alleging noncompliance with the noise standard, section 1910.95(b)(1).

---

3/ Section 6(b)(5), 29 U.S.C. § 655(b)(5), of the Act provides in pertinent part:

> The Secretary, in promulgating standards dealing with toxic materials or harmful physical agents under this subsection, shall set the standard which most adequately assures, to the extent feasible, on the basis of the best available evidence, that no employee will suffer material impairment of health or functional capacity. . . .

At the hearing, the Secretary proposed engineering controls to reduce the excessive noise. An expert, a consulting engineer with experience in noise control, testified about the controls and the costs involved in implementing them. He gave a figure representing the cost of fabricating the controls but he did not quantify any indirect costs, such as any loss of productivity, incidental to using the controls.

At the close of the Secretary's case, Sun Ship moved to dismiss the charges on the basis that the Secretary's case was insufficient. Sun Ship argued that the Secretary failed to meet his burden of proof under Continental Can, supra, because he failed to demonstrate indirect costs. Administrative Law Judge William E. Brennan, before whom the case was tried, granted Sun Ship's motion to dismiss. He concluded that the Secretary failed to meet the burden of proof imposed by Continental Can since he did not establish the indirect costs of the engineering controls.

The Secretary filed a petition for discretionary review which Commissioner Cleary granted.[4/] The Commission subsequently issued the following briefing order:

> (1) What impact, if any, does the United States Supreme Court decision in American Textile Manufacturers Institute, Inc. v. Donovan . . . have on the Commission interpretation of 29 C.F.R. § 1910.95 (b)(1) set forth in . . . Continental Can Co. . . .
>
> (2) What impact, if any, does the decision in Carnation Co. v. Secretary of Labor, 641 F.2d 801 (9th

---

4/ The case is before the Commission pursuant to § 12(j) of the Act, 29 U.S.C. § 661(i). Prior to the Supreme Court's decision in ATMI, the parties filed briefs with the Commission. The Secretary contended that Continental Can was wrongly decided and that, under a proper burden of proof, his case was sufficient. Sun Ship contended that the Secretary's case was insufficient under Continental Can and therefore was properly dismissed.

Cir. 1981), have on whether the Secretary established a prima facie case that Respondent violated 29 C.F.R. § 1910.95(b)(1)?5/

Sun Ship argues that ATMI does not affect Continental Can because ATMI involved a section 6(b)(5)6/ rather than a section 6(a)7/ standard, ATMI involved a life-threatening hazard, and under ATMI cost-benefit may be used to determine the feasible abatement to reach a given exposure level. The Secretary argues that ATMI requires Continental Can to be overruled. In the Secretary's view, "feasible" must be given the same meaning in the noise standard as in section 6(b)(5). Also, the

---

5/ Sun Ship argued to the judge and on review that the Secretary was required, as a part of his prima facie case, to establish the feasibility of the proposed engineering controls for all other, similar operations performed in Sun Ship's facility, not just the feasibility of controls for the one cited operation. A similar claim was made in Carnation Co. v. Secretary of Labor. The Court of Appeals for the Ninth Circuit held that the employer must be given the opportunity to show "that a piecemeal approach differs significantly from a plant-wide approach," 641 F.2d at 805, and that, if the employer shows there would be significantly different results, then the Secretary must show that his controls are feasible for the entire plant.

6/ Section 6(b) authorizes the Secretary to adopt safety and health standards after notice and an opportunity to comment. See §§ 6(b)(2)-(4). Section 6(b)(5) contains specific requirements imposed on "[t]he Secretary, in promulgating standards dealing with toxic materials or harmful physical agents under this subsection. . . ." In ATMI the Supreme Court reviewed a standard regulating exposure to cotton dust which was adopted pursuant to § 6(b)(5).

7/ Section 6(a) authorized the Secretary to adopt safety and health standards without regard to other requirements for notice and comment rulemaking proceedings in the Administrative Procedure Act, 5 U.S.C. §§ 551-706, and in this Act. The authority was limited to the two years following the effective date of the Act and concerned adoption of national consensus standards, see 29 U.S.C. § 652(9), and established federal standards, see 29 U.S.C. § 652(10). See generally S.Rep. No. 1282, 91st Cong., 2d Sess., at 5-6, reprinted in Legislative History of the Occupational Safety and Health Act of 1970, at 145-46 (1971). The noise standard, § 1910.95, was an established federal standard adopted as an occupational safety and health standard pursuant to § 6(a). The standard was originally promulgated by the Secretary under the Walsh-Healey Act, 41 U.S.C. §§ 35-45.

Act does not require a cost-benefit analysis for a standard adopted under section 6(a).

II

In ATMI the Supreme Court interpreted the language of section 6(b)(5) which states:

> The Secretary, in promulgating standards dealing with toxic materials or harmful physical agents under this subsection, shall set the standard which most adequately assures, to the extent feasible, on the basis of the best available evidence, that no employee will suffer material impairment of health or functional capacity. . . .

The Court was confronted with an industry challenge to a standard regulating employee exposure to cotton dust. The standard was adopted by the Secretary under section 6(b)(5) and the industry parties contended that the Act requires the Secretary to balance costs and benefits when promulgating a standard under this section.

Focusing on the phrase "to the extent feasible," the Court held that "feasible" means "capable of being done" or "achievable." 101 S.Ct. at 2490, 2494. The Court looked to the "plain meaning" of the word — the common definition. The Court also examined other statutes and found that "[w]hen Congress has intended that an agency engage in cost-benefit analysis, it has clearly indicated such intent on the face of the statute." 101 S.Ct. at 2491. From this, the Court concluded that, in view of the common definition of "feasible," the word as used by Congress in section 6(b)(5) cannot be understood to impose a requirement for cost-benefit analysis. In addition, the Court reviewed the legislative history of the Act and concluded:

> The legislative history of the Act, while concededly not crystal clear, provides general support for . . . [the conclusion that 'feasible' does not require

> cost-benefit analysis]. The congressional reports and debates certainly confirm that Congress meant 'feasible' and nothing else in using that term. Congress was concerned that the Act might be thought to require achievement of absolute safety, an impossible standard, and therefore insisted that health and safety goals be capable of economic and technological accomplishment. Perhaps most telling is the absence of any indication whatsoever that Congress intended OSHA to conduct its own cost-benefit analysis before promulgating a toxic material or harmful physical agent standard. The legislative history demonstrates conclusively that Congress was fully aware that the Act would impose real and substantial costs of compliance on industry, and believed that such costs were part of the cost of doing business.

101 S.Ct. at 2493. The Court specifically concluded from its examination of the congressional discussions of general costs and general employee benefits:

> Nowhere is there any indication that Congress contemplated a different balancing by OSHA of the benefits of worker health and safety against the costs of achieving them. Indeed Congress thought that the <u>financial costs</u> of health and safety problems in the workplace were as large or larger than the <u>financial costs</u> of eliminating these problems. In its statement of findings and declaration of purpose encompassed in the Act itself, Congress announced that 'personal injuries and illnesses arising out of work situations impose a substantial burden upon, and are a hinderance to, interstate commerce in terms of lost production, wage loss, medical expenses, and disability compensation payments.' 29 U.S.C. § 651(a).

101 S.Ct. at 2496-2497 (emphasis by the Court).

In sum, in <u>ATMI</u> the Supreme Court held that, because neither the Act nor its legislative history reveals that Congress intended to require a cost-benefit analysis as a part of rulemaking under section 6(b)(5), the word "feasible" in that section must be given its ordinary meaning -- that which is "achievable." Significantly, the Court determined that Congress, in enacting the Act, believed that the costs of employee injuries and illnesses were at least as great as, and likely greater than, the costs of

eliminating injuries and illnesses and that, therefore, the benefits of reduced injuries and illnesses generally justified the costs that would be incurred in doing so.

The Court's interpretation of "feasible" is limited, Sun Ship argues in this case, to standards promulgated under section 6(b)(5). Because the noise standard was promulgated under section 6(a) of the Act, see note 7 supra, and neither Congress nor the Secretary ever considered the balance of costs against benefits for this standard, Sun Ship argues that cost-benefit analysis should be required to enforce the standard. Accordingly, Sun Ship urges that the Commission adhere to Continental Can.

We find these arguments unpersuasive in light of the Court's decision. Clearly, the Supreme Court decided only the meaning of section 6(b)(5) and not whether cost-benefit analysis might be required for standards promulgated under other sections. See 101 S.Ct. at 2490 n. 29 and 2493 n. 32. However, the Supreme Court held that, because of the absence of any strong indication that Congress intended "feasible" to have a special meaning, "feasible" as used by Congress must be given its ordinary meaning. The Court further held that, under its ordinary meaning of "achievable," "feasible" cannot require cost-benefit analysis. See 101 S.Ct. at 2490, 2492. The Court thus decided that Congress did not intend to require cost-benefit analysis by using the word "feasible." The identical question of legislative intent is presented in interpreting the noise standard.

The pertinent language of the noise standard is: "When employees are subjected to sound exceeding those listed . . . , feasible administrative or engineering controls shall be utilized." The Secretary adopted this language in the noise standard because Congress directed that the Walsh-Healey standards, one of which was the noise standard,

be adopted as occupational safety and health standards under section 6(a). See note 7 supra. Accordingly, the Commission in Continental Can examined the Walsh-Healey Act and its history as well as the history of the noise standard to determine whether "feasible" had any special meaning. However, there was no indication that the word was intended to have any meaning other than the common definition. In these circumstances, the Commission concluded, "The standard must be interpreted to effectuate the Congressional purposes underlying the Act." 4 BNA OSHC at 1546, 1976-77 CCH OSHD at p. 25,255.

Because "feasible" had no special meaning under the Walsh-Healey Act, it is appropriate to interpret it in accordance with the Congressional purpose underlying the OSH Act. But, as held by the Supreme Court in ATMI, "feasible" under the OSH Act means "achievable" and does not require cost-benefit analysis. Regulations are to be construed consistent with the statutes under which they are promulgated. United States v. American Trucking Ass'ns, 310 U.S. 534, 542 (1940). Furthermore, unless a different intent is clearly evident the same statutory terms are to be given the same meaning. Chugach Natives, Inc. v. Dayon Ltd., 588 F.2d 723 (9th Cir. 1979) and cases cited. Accordingly, regulatory language should be given the same meaning as the same language appearing in the statute. See Baroid Div. of N.L. Industries, Inc. v. OSHRC, 660 F.2d 439, 447 (10th Cir. 1981), and RMI Co. v. Secretary of Labor, 594 F.2d 566 (6th Cir. 1979), where the statutory and regulatory uses of "feasible" are viewed as synonymous.[8/] Accordingly, we overrule

---

8/ Our dissenting colleague claims that the Commission errs in applying the Court's ATMI interpretation of the statutory term "feasible"

(continued on next page)

Continental Can to the extent that it ho'ds that "feasible" in the noise standard requires cost-benefit analysis.[9/]

---

8/ (continued)

to the interpretation of the same term in a section 6(a) standard. This new interpretation conforms the Commission's interpretation of "feasibility" to the language and intent of the Act as interpreted by the Supreme Court. Moreover, reappraisal of precedent is permissible in the administrative process though the reversal of precedent must be guided by caution. See NLRB v. J. Weingarten, Inc., 420 U.S. 251, 265-6 (1975); Atchison, Topeka & Santa Fe R.R. Co. v. Wichita Board of Trade, 412 U.S. 800 (1973); NLRB v. Wentworth Inst., 515 F.2d 550, 555 (1st Cir. 1975). Accordingly, we reject our dissenting colleague's suggestion that the Commission's overruling of its precedent of 6 years and its substitution of a new interpretation of the term "feasible" supports his contention that the standard is unenforceably vague.

9/ The United States Court of Appeals for the Ninth Circuit recently issued its decision in Donovan v. Castle & Cooke Foods, A Div. of Castle & Cooke, Inc., No. 77-2565 (9th Cir. Nov. 19, 1982), affirming a 1977 Commission decision that applied the Continental Can cost-benefit test. The court concluded that the Commission's interpretation was "neither unreasonable, arbitrary, nor an extension of the authority granted the Commission by the Act," slip. op. at 13, under the applicable standard for judicial review of agency decisions, slip. op. at 6. The court deferred to the Commission's expertise in interpreting the standard. This case involves a necessary reevaluation of Continental Can and a reinterpretation of the noise standard in light of the Supreme Court's decision in ATMI.

The Ninth Circuit considered the Supreme Court's interpretation of the term "feasible" in section 6(b)(5) of the Act to be inapplicable to section 6(a) standards. However, we treat as identical the term "feasible" in the statute and the noise standard. When Congress authorized the Secretary to adopt established federal standards and national consensus standards as occupational safety and health standards, it understood that the Walsh-Healey standards would be the primary source of established federal standards for covered workplace hazards. General Motors Corp., GM Parts Div., 81 OSAHRC 13/C10, 9 BNA OSHC 1331, 1336-37, 1981 CCH OSHD ¶ 25,202 at pp. 31,122-24 (No. 79-4478, 1981), appeal dismissed, No. 81-3194 (6th Cir. Sept. 16, 1981). Several of these standards, like the noise standard, regulated exposure to "toxic materials" and "harmful physical agents" and contained feasibility requirements. At the same time that Congress authorized the adoption of section 6(a) standards, it authorized the promulgation of standards dealing with toxic materials or harmful physical agents under section 6(b)(5). Section 6(b)(5) also contains a feasibility requirement. There is no

(continued on next page)

The Supreme Court did not, however, reject the idea that "feasible" includes economic considerations. All parties in ATMI agreed that a standard would not be feasible if its costs would be so high as to threaten the economic viability of an industry.[10/] The Court did not disagree, expressing the view that inclusion of economic considerations "is certainly consistent with the plain meaning of the word 'feasible.'" 101 S.Ct. at 2501 n. 55. In promulgating the standard in ATMI, the Secretary had estimated the costs of compliance for the different sectors of the cotton industry affected by the standard and evaluated their

---

9/ (continued)

indication that Congress intended the feasibility requirement of existing standards that the Secretary was authorized to implement immediately to be measured by a different criterion than feasibility under section 6(b)(5).

Accordingly, we respectfully decline to acquiesce in the Ninth Circuit's divergent interpretation of the term "feasible." Rather, we view the ATMI interpretation to be applicable to the regulation in question. Cf. Baroid Div. of N.L. Industries, Inc. v. OSHRC, 660 F.2d 439, 447 (10th Cir. 1981) (definition of "feasible" as economically and technologically capable of being done applied to a section 5(a)(1) violation based on Supreme Court's definition in ATMI).

10/ In an early case involving a challenge by a union to the promulgation of a § 6(b)(5) standard, the Court of Appeals for the District of Columbia Circuit held that the Secretary could properly consider the economic impact on an industry in determining whether a standard is feasible. Industrial Union Department, AFL-CIO v. Hodgson, 499 F.2d 467 (D.C. Cir. 1974). That holding has been followed in other decisions involving challenges to 6(b)(5) standards. United Steelworkers of America, AFL-CIO-CLC v. Marshall, 647 F.2d 1139, 1265 (D.C. Cir. 1980), cert. denied, 101 S.Ct. 3148 (1981); American Iron & Steel Institute v. OSHA, 577 F.2d 825 (3d Cir. 1978), cert. dismissed, 448 U.S. 917 (1980). Thus, by the time ATMI was decided by the Supreme Court, there was no longer any real dispute that the Secretary could, and indeed must, consider the economic impact on an industry in determining feasibility. Indeed, in the industry challenge to the cotton dust standard that led to the Supreme Court's decision in ATMI, the D.C. Circuit held that the Secretary had not established the economic feasibility of the standard for the cottonseed oil industry. AFL-CIO v. Marshall, 617 F.2d 825 (D.C. Cir. 1979). That holding was not in issue before the Supreme Court.

ability to absorb the costs. Because he concluded that compliance with the standard would not threaten the "long-term profitability and competitiveness" of the various industrial sectors, the Secretary concluded that the standard was feasible. Id.

Thus, "feasibility" under section 6(b)(5) includes consideration of whether the cost of compliance with a standard will be so great as to threaten an industry's long-term profitability and competitiveness. By analogy, considerations of cost must also enter into whether administrative or engineering controls are "feasible" under section 1910.95(b)(1).[11/] Generally, administrative or engineering controls would be economically infeasible if their cost would seriously jeopardize the cited employer's long-term financial profitability and competitiveness.[12/] There may

---

11/ The initial inquiry into feasibility of administrative or engineering controls involves whether such controls are technologically feasible. The Commission has held that, because the standard expressly requires that administrative or engineering controls be used in preference to personal protective equipment, controls which achieve a significant reduction in noise exposure will be deemed technologically feasible even if they do not result in absolute compliance with Table G-16 levels. Continental Can Co., 4 BNA OSHC at 1545-46, 1976-77 CCH OSHD at pp. 25,254-55; see also Samson Paper Bag Co., supra; Turner Co., 76 OSAHRC 108/A2, 4 BNA OSHC 1554, 1976-77 CCH OHSD ¶ 21,023 (No. 3635, 1976), rev'd on other grounds, 561 F.2d 82 (7th Cir. 1977). This test for technological feasibility is consistent with the ordinary meaning of "feasible" as set forth by the Supreme Court in ATMI.

12/ In most cases arising under the noise standard, there will not be a serious question of the employer's ability to afford the cost of technologically feasible controls; economic feasibility will be clear. See, e.g., Continental Can Co., 4 BNA OSHC at 1542 n.4, 1976-77 CCH OSHD at p. 25,251 n.4. It has been our experience that the controls suggested by the Secretary in cases arising under section 1910.95(b)(1) are not generally so expensive as to give rise to substantial question of their economic feasibility. Moreover, in most cases it will be possible to alleviate the employer's financial difficulty by extending the time required for the installation of controls. See Samson Paper Bag Co., supra (lead and separate opinions). Thus, in cases where financial hardship is asserted, the Commission will consider whether this hardship can be adequately cured through an extended abatement date before concluding that the controls are infeasible.

(continued on next page)

also, as the Secretary points out, be situations in which a particular employer is lagging so far behind its industry in protecting the health and safety of its employees that it cannot afford to implement controls that are generally feasible throughout the industry. See Industrial Union Department, AFL-CIO v. Hodgson, 499 F.2d 467, 478 (D.C. Cir. 1974). In these situations, controls may be feasible even though they are beyond the financial capability of the cited employer. Thus, as part of his proof of feasibility, the Secretary must show either that the cost of engineering and administrative controls will not threaten the cited employer's long-term profitability and competitiveness or that the employer's inability to afford the cost of controls results from the employer lagging behind its industry in providing safety and health protection for employees.[13/]

---

12/ (continued)

Commissioner Cleary notes that, when there is a question whether controls will be so costly as to threaten an employer's ability to remain in business, a range of economic factors may merit consideration. These factors could include the competitive structure of the industry involved, the competition that the industry faces from other industries or from other countries, inflation, the ability of the company to raise capital, its ability to alter employees' work schedules and assignments, its other capital investment requirements, energy costs, and the like. See ATMI; Samson Paper Bag, supra (Cleary, concurring).

13/ In Commissioner Cleary's view, the Secretary may make out a prima facie showing of economic feasibility by showing that the estimated costs of the controls are small compared with other figures that represent the company's financial ability. For example, if implementation of the controls would require an initial capital investment, the Secretary could show that the company regularly makes capital investments that are substantially larger than implementation of the controls would require. If the controls would involve annual costs, the Secretary could show that the company's annual cash flow or profits, over a representative period of time, are substantially larger than the annual cost the controls would impose. Such information is readily available to the Secretary either through public reports that corporations must file or through discovery.

(continued on next page)

III

In this case, the Secretary's charges under the noise standard were dismissed at the close of the Secretary's evidence. The question is whether the Secretary made a prima facie case of violation under our interpretation of the noise standard. The evidence presented during the Secretary's case-in-chief is as follows.

On September 30, 1975, a blacksmith was performing grinding and blacksmith work for shipfitting and fabrication in a building in Sun Ship's shipyard. Using a dosimeter and a sound level meter, the compliance officer measured the noise to which the blacksmith was exposed during his shift.

During the morning half of his shift, the blacksmith worked in the shipfitting end of the building grinding steel hatch opening rings. He used a Stanley V-50 pneumatic hand-held grinder which was not equipped with a muffler. A metal workbench was used to hold each ring as it was ground. The ring was not clamped to the workbench. Also, there were eight or nine other employees performing welding, grinding, and shipfitting work in the vicinity of the blacksmith.

With the sound level meter, the compliance officer measured the noise levels. She found that they ranged from 101 to 108 dBA while the

---

13/ (continued)

The employer may then rebut the Secretary's case by showing that the cost figures are incorrect or that additional, indirect, costs will be incurred, or that any of the factors listed above, such as the competitive structure of the industry, make controls infeasible. The employer may also rebut the Secretary's case by showing that while controls for the cited locations are economically feasible, the cost of plant-wide controls would exceed the bounds of economic feasibility. Carnation Co. v. Secretary of Labor, 641 F.2d 801 (9th Cir. 1981).

blacksmith was using the grinder in contact with a hatch opening ring and the other employees were working in the background. When there was no background noise but the blacksmith was using the grinder on a ring, the noise levels were 102 to 103 dBA. The background noise alone was 90 to 92 dBA. The noise levels were below 90 dBA when no employees were working.

The compliance officer timed the blacksmith's grinding activities. She watched the employee grinding several of the rings and, using a stop watch, she timed the intervals during which he held the grinder in contact with the ring. She found that the intervals added up to about five minutes per ring, on the average. Since eleven rings were ground that morning, the compliance officer attributed one hour of the morning portion of the shift to grinder-to-metal work.

Between the intervals of grinder-to-metal work, the blacksmith was doing such things as adjusting the ring on the workbench or adjusting the grinder. During these times, he was exposed only to background noise and/or noise from his grinder which may have been switched on. He was not holding the grinder in contact with anything, however. Because the blacksmith spent a total of about three hours working on grinding the eleven hatch opening rings but one of those hours could be attributed to grinder-to-metal work, the compliance officer attributed the remaining two hours to pre-grinding work involving exposure mainly to background noise. There remained approximately one hour during which the blacksmith was performing some unidentified activities not involving exposure to any of this noise. The compliance officer concluded that during this hour the blacksmith's noise exposure was below 90 dBA.

During the afternoon half of his shift, the blacksmith performed blacksmith work in the fabrication end of the same building. With the sound level meter, the compliance officer found that the noise level was generally 92 dBA. She also found that the blacksmith was exposed to this noise level for about 3.25 hours.

With the information compiled about the various sound levels and time intervals, the compliance officer was able to compute the blacksmith's total noise exposure. The compliance officer's data indicated that the blacksmith was exposed to the following minimum noise levels for the following times:

| | |
|---|---|
| 102 dBA | - 1 hour (grinder-to-metal work — no background noise) |
| 90 dBA | - 2 hours (background noise only) |
| less than 90 dBA | - 1 hour (unidentified work) |
| 92 dBA | - 3.25 hours (blacksmith work) |

Table G-16, note 1 supra, gives the permissible exposure time for each of these noise levels. The footnote to the table states that the combined effect of exposure to two or more periods of noise exposure at different levels may be determined by computing the sum of fractions $C_n/T_n$ where $C_n$ is the total actual exposure time and $T_n$ is the permissible exposure time for the particular noise level. In this case, the fractions added up to 1.46.[14/] Because the sum exceeded unity (one),

---

14/ The following fractions were added:

1/1.5 + 2/8 + 1/infinity (zero) + 3.25/6

(The permissible time for exposure to 102 dBA is 1.5 hours, for 90 dBA is 8 hours, for less than 90 dBA is unlimited, and for 92 dBA is 6 hours).

the compliance officer concluded that the blacksmith was exposed to excessive noise.

The compliance officer also used a dosimeter to judge the blacksmith's noise exposure. The blacksmith wore the dosimeter while he was engaged in performing the grinding and blacksmith work. The total readout was 168 percent of permissible noise exposure which showed exposure to excessive noise. Because both the dosimeter readout and the computation based on the sound level meter measurements revealed excessive noise exposure, the Secretary issued the citation alleging noncompliance with the noise standard with respect to the blacksmith.

At the hearing, the Secretary presented expert testimony proposing engineering controls for the hatch opening ring grinding operation. The expert visited Sun Ship's facility and tested the noise levels generated by a Stanley V-50 pneumatic grinder which was being used to grind the metal substructure of a ship. He found that the levels were generally 92 dBA when the grinder was in contact with the metal. When the grinder was not in contact, the levels were about 90 dBA. Any higher noise levels detected during grinder-to-metal work are generally attributable almost entirely to vibration of the work piece. Also, large metal objects such as this metal ship substructure produce little significant vibration noise while being ground. The expert concluded from his tests that the noise level produced by the grinder alone was about 92 dBA. He testified that the 102 dBA noise levels detected by the compliance officer while the blacksmith was grinding hatch opening rings but there was no background noise were attributable to two sources, the grinder itself and the hatch opening rings vibrating on the workbench. Therefore, the expert recommended muffling the grinder and using a sound-dampening workbench.

The expert testified that the primary source of the noise generated by the grinder is the exhaust air port, where the pressurized air exhausts after turning the turbine of the grinder. Accordingly, the expert proposed enclosing the exhaust air port and attaching a muffler. The expert testified that from Stanley, the manufacturer of the grinder, he learned that a muffled version of the grinder can be purchased. He also learned that, although Stanley does not produce a retrofit kit to muffle the older V-50 grinder, for $200 an employer can purchase the muffling parts of the newer grinder and apply them to the older tool. However, because Stanley does not produce the parts specifically adapted to retrofit the older V-50, the Secretary's expert designed a muffler for the grinder. His design consisted of a housing enclosing the exhaust air port and a hose leading to a muffler. The expert estimated that the design cost would be $1500 and the fabrication cost would be $320, a total of $1820.[15/] He also estimated, based on his experience in muffling grinding tools, that a 3 dBA reduction would result and as much as a 6 dBA reduction could be possible.

The expert also recommended that the metal workbench be replaced with a wooden one and that the workbench be equipped with clamps to

---

15/ The expert estimated that the muffler could be designed in one day for about $400. In two days, a draftsman could produce detailed engineering design drawings and investigate the availability of materials. The cost for the draftsman's work would be about $800. The expert estimated that additional expenses could bring the design cost to about $1500.

The expert further estimated that labor for making the housing would be about $120 (for 6 hours at $20 per hour). Labor at the same wage rate for the muffler would be about $80 (4 hours) and about $80 (4 hours) to apply the parts to the tool. The expert estimated the cost of materials at about $40, for a total fabrication cost of approximately $320.

hold the hatch opening rings securely to the workbench during grinding. The expert estimated that the cost of materials and labor for this workbench would be about $460.

IV

The Secretary's evidence shows employee exposure to excessive noise. The principal question is whether the evidence shows there are feasible engineering controls for the excessive noise. According to the expert's testimony, the muffler would result in a 3 dBA reduction in the noise produced by the grinder alone, which the expert determined was approximately 92 dBA. Further, the elevation in noise levels during grinder-to-metal work results from vibration noise. Accordingly, vibration noise accounts for approximately 10 dBA of the 102 dBA noise levels detected by the compliance officer while the blacksmith was using the grinder in contact with the hatch opening rings.[16/] With a 3 dBA reduction in grinder noise and most of the vibration noise eliminated,[17/] the Secretary's evidence shows that the blacksmith's exposure will be within permissible limits.[18/]

---

16/ Because the compliance officer detected noise levels of 102 dBA when there was no background noise (from other employees working near the blacksmith), we do not ascribe any part of the elevated noise levels to background noise.

17/ The Secretary's expert did not specify what dBA reduction he would expect from the sound-dampening workbench, but he testified that it should be made of wood which he stated has "significant" sound-dampening properties. He also specified that the workbench should have clamps to hold the workpiece in place firmly against the wood. Thus, most if not all vibration noise can be eliminated using the wooden workbench with clamps.

18/ On the basis of the expert's testimony, see note 17 supra, most of the vibration noise can be eliminated. Because the noise level was 102 dBA when the blacksmith was exposed only to the noise generated by grind-

(continued on next page)

The Secretary's evidence also establishes that the cost of implementing the controls will be about $2,500. See note 15 supra and accompanying text. The judge dismissed the Secretary's charges because the Secretary did not show the indirect costs, such as inefficiency or loss of productivity, that might result from implementation of the controls. We can infer, however, that such indirect costs would be negligible. Substitution of a wooden workbench for a metal one should present no impediment to Sun Ship's grinding process. Moreover, the fact that muffled grinders are available commercially suggests that grinders can be successfully muffled without a significant adverse effect on performance.

The Secretary's evidence also establishes that Sun Ship has annual sales in excess of $100 million. In light of this, we infer that the $2,500 cost of the controls will not adversely affect Sun Ship's long-

---

18/ (continued)

ing metal and about 10 dBA of this noise level was vibration noise, we find that using the proposed workbench can be expected to reduce the vibration noise by approximately 7-8 dBA. Adding to this the 3 dBA reduction in grinder noise, the 102 dBA noise level can be reduced by about 10-11 dBA. The computation based on Table G-16 and the footnote to it, see note 1 supra, will be:

1/6 + 2/8 + 1/infinity (zero) + 3.25/6

(The permissible time for exposure to 92 dBA is 6 hours.)

The compliance officer's computation was:

1/1.5 + 2/8 + 1/infinity (zero) + 3.25/6

The sum will be .96 rather than 1.46. See note 14 supra and accompanying text. The total reduction may be even greater. The expert stated that a 6 dBA reduction in grinder noise from the muffler could be possible.

term profitability and competitiveness. We therefore conclude that the Secretary has established a prima facie case. In making this conclusion, we have not taken into account whether abatement on a plant-wide basis will threaten Sun Ship's long-term profitability and competitiveness. See note 5 supra and accompanying text. However, we conclude that, to make a prima facie case, the Secretary is not required to show more than that the controls are economically feasible for the cited operation or location. As the Court of Appeals for the Ninth Circuit stated in Carnation Co. v. Secretary of Labor, supra, in rejecting the employer's argument that the Secretary was required to inspect the entire plant for noise violations and issue a comprehensive citation:

> It would be a waste of government money and energy to compel the Secretary to prove the economic feasibility of plant-wide controls where there is no suggestion by the violator that such controls would be economically infeasible. . . . The matter would be entirely different if a violator were able to show that the controls installed at discrete locations, while economically feasible, would not be economically feasible were they installed throughout the plant. The latter case would be impermissible because the Secretary could carry his burden and prove economic feasibility under 29 C.F.R. § 1910.95 by piecemeal proof in situations where he would not be able to prove economic feasibility had he required the violator at the outset to remedy all the violations in the plant.

641 F.2d at 803.

Accordingly, we conclude that the Secretary has established a prima facie case of violation of the noise standard.[19/] The judge's decision

---

19/ The cases relied on by our dissenting colleague in support of his conclusion that the noise standard is unenforceable because it is "so uncertain of meaning as to result in arbitrary and discriminatory treatment" are inapposite to these proceedings because they involve either

criminal or First Amendment issues. The standard for review of the constitutional sufficiency of a regulatory warning is not the "reasonably explicit" test taken from Grayned v. City of Rockford, 408 U.S. 104 (1972). As the omitted footnote citations to Papachristou v. City of Jacksonville, 405 U.S. 156, 162 (1972), reveal, the test of Grayned is subject to the qualification that administrative regulations are governed by a less stringent standard. 408 U.S. at 108-09 nn. 3 & 4; see Diebold, Inc. v. OSHRC, 585 F.2d 1327, 1337 (6th Cir. 1978).

> When considering remedial legislation such as the OSH Act and its implementing regulations, the purported vagueness of a standard is judged not on its face but rather in the light of its application to the facts of the case. PBR, Inc. v. Secretary of Labor, 643 F.2d 890, 897 (1st Cir. 1981); McLean Trucking Co. v. OSHRC, 503 F.2d 8, 10-11 (4th Cir. 1974). Moreover, the regulations will pass constitutional muster even though they are not drafted with the utmost precision; all that due process requires is a fair and reasonable warning. Allis-Chalmers Corp. v. OSHRC, 542 F.2d 27, 30 (7th Cir. 1976).

Faultless Div., Bliss & Laughlin Indus., Inc. v. Secretary of Labor & OSHRC, 674 F.2d 1177, 1185 (7th Cir. 1982). See Diebold, Inc. v. OSHRC, supra, citing, Boyce Motor Lines v. United States, 342 U.S. 337, 340 (1952). A standard is not unconstitutionally vague simply because judgment must be exercised in determining its application. See Bethlehem Steel Corp., 82 OSAHRC , 10 BNA OSHC 1673, 1677 n.8, 1982 CCH OSHD ¶ 26,093 at p. 32,832 n.8 (No 77-1807, 1982). See Turner Co., supra note 11. A standard must be read in light of the conduct to which it is addressed. United States v. National Dairy Products, Inc., 372 U.S. 29, 36 (1963); Bethlehem Steel Corp., supra.

Additionally, while we do not agree with the dissenting Member that the standard in question is constitutionally infirm, we note that

> [I]t is axiomatic that defects in the constitutional sufficiency of a regulatory warning may be cured by authoritative judicial or administrative interpretations which clarify obscurities or resolve ambiguities.

Diebold, Inc. v. OSHRC, 585 F.2d at 1338 (footnote omitted), citing, Rose v. Locke, 423 U.S. 48, 52 (1975); Parker v. Levy, 417 U.S. 733,

(continued on next page)

is remanded for further proceedings.[20/] SO ORDERED.

FOR THE COMMISSION

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: DEC 17 1982

---

19/ (continued)

752-54 (1974); Smith v. Gougen, 415 U.S. 566, 575 (1974); Wainwright v. Stone, 414 U.S. 21, 22-23 (1973); Jackson v. Dorrier, 424 F.2d 213, 217-18 (6th Cir.), cert. denied, 400 U.S. 850 (1970). See S & H Riggers & Erectors, Inc., 79 OSAHRC 23/A2, 7 BNA OSHC 1260, 1264 & n.14, 1978 CCH OSHD ¶ 23,490 at p. 28,437 & n.14 (No. 15855, 1979), rev'd on other grounds, 659 F.2d 1273 (5th Cir. 1981).

The Commission has consistently and repeatedly held that the noise standard is not unenforceably vague. E.g., Turner Co., supra, cited in Wheeling-Pittsburgh Steel Corp., 79 OSAHRC 66/A2, 7 BNA OSHC 1581, 1979 CCH OSHD ¶ 23,784 (No. 14702, 1979); Wheeling Corrugating Co., A Div. of Wheeling-Pittsburgh Steel Corp., 77 OSAHRC 204/E9, 6 BNA OSHC 1661, 1977-78 CCH OSHD ¶ 22,350 (No. 13286, 1977), petition denied, No. 77-1030 (3d Cir. Nov. 20, 1978); Castle & Cooke Foods, A Div. of Castle & Cooke, Inc., 77 OSAHRC 87/A2, 5 BNA OSHC 1435, 1977-78 CCH OSHD ¶ 21,954 (No. 10925, 1977), aff'd, No. 77-2565 (9th Cir. Nov. 19, 1982); accord Plum Creek Lumber Co. v. Hutton, 608 F.2d 1283 (9th Cir. 1979); cf. Turner Co. v. Secretary of Labor, 561 F.2d 82, 84 (7th Cir. 1977) (consideration of relevant economic considerations under Continental Can will "obviate any due process challenge"). The term "feasible" is not so devoid of meaning that a fair determination of the required conduct cannot be made. See Boyce Motor Lines v. United States, supra. Furthermore, one of the cases relied on by our colleague indicates that perceived ambiguities can be cured by interpretation -- a course that is preferable to invalidation. See International Society for Krishna Consciousness of Atlanta v. Eaves, 601 F.2d 809, 822 (5th Cir. 1979).

In ATMI v. Donovan, the Court determined that the term "feasibility" had an ascertainable meaning based on the statute. 101 S.Ct. at 2490. The definition set forth by the Court is applicable to the regulation at issue. We reject our colleague's suggestion that the term is devoid of meaning.

20/ Commissioner Cottine further notes that the dissent's conclusion that the noise standard represents an impermissible delegation depends

(continued on next page)

20/ (continued)

on the erroneous premise that the noise standard is vague. The dissent characterizes the noise standard as an impermissible delegation to the Commission of the Secretary's authority to promulgate standards and establish enforcement criteria under the Act. This broad characterization ignores the fact that the noise standard establishes a definite criteria for occupational noise exposure -- an 8-hour time weighted average of 90 dBA. § 1910.95(a). This required performance is to be achieved by "feasible" administrative or engineering controls. § 1910.95(b). As previously noted, the term "feasible" permits a fair determination of the required conduct and is capable of application to the factual controversies presented to this adjudicatory forum. See Boyce Motor Lines v. United States, supra note 19. Like any factual inquiry "feasibility" is determined by the unique characteristics of an employer's economic conditions and the technological attributes of the abatement methodology. The "feasibility" criterion is ascertainable and the possibility of more than one interpretation does not justify invalidation under the delegation doctrine. ATMI v. Donovan, 101 S.Ct. at 2506 n.75. The mere fact that a term requires a factual analysis does not invalidate the standard. Factual determinations are both the heart of adjudication and the focus of delegation. See Atlas Roofing Co., Inc. v. OSHRC, 430 U.S. 442, 449-60 (1977). See generally L. Jaffe, Judicial Control of Administrative Action ch. 3 (1965). Moreover, a feasibility determination is the type of complex fact-finding regularly committed to an administrative agency for specialized adjudication in the context of the forum's experience and expertise. See, e.g., Crowell v. Benson, 285 U.S. 22, 46-47 (1932); Reconstruction Finance Corp. v. Bankers Trust Co., 318 U.S. 163, 170 (1943). Accordingly, Commissioner Cottine rejects the dissent's conclusion that the noise standard is unenforceable because the regulatory use of the term "feasible" results in an impermissible delegation.

In addition, Commissioner Cottine notes that the Commission's adjudicatory responsibility does not permit it to question a standard's stringency or appropriateness. W.J. Lazynski, Inc., 79 OSAHRC 108/B6, 7 BNA OSHC 2064, 2072, 1980 CCH OSHD ¶ 24,145 at p. 29,336 (No. 13864, 1979); Austin Bridge Co., 79 OSAHRC 81/A2, 7 BNA OSHC 1761, 1764, 1979 CCH OSHD ¶ 23,934 at p. 29,021 (No. 76-93, 1979); Fleming Foods of Nebraska, Inc., 77 OSAHRC 196/C12, 6 BNA OSHC 1233, 1978 CCH OSHD ¶ 22,889 (No. 14484, 1977). However, the Commission's independent adjudicatory responsibility necessarily includes the interpretation of the statute and its implementing regulations. Donovan v. Castle & Cooke Foods Div., Castle & Cooke, Inc., No. 77-2565, slip op. at 7 (9th Cir. Nov. 19, 1982) and cases cited; Brennan v. OSHRC & Ron M. Fiegen, Inc., 513 F.2d 713 (8th Cir. 1975). In interpreting the term "feasibility," it is irrelevant that the Secretary has under consideration revisions to the present standard, see, Modern Drop Forge Co. v. Secretary of Labor, 683 F.2d 1105, 1111 (7th Cir. 1982); Koppers Co., Inc., 77 OSAHRC 44/A2,

(continued on next page)

2 BNA OSHC 1354, 1974-75 CCH OSHD ¶ 19,063 (No. 3449, 1974); United States Steel Corp., 77 OSAHRC 12/C3, 2 BNA OSHC 1343, 1974-75 CCH OSHD ¶ 19,047 (Nos. 2975 & 4349, 1974) (alternate holding), appeal dismissed, 517 F.2d 1400 (3d Cir. 1975), or that individual members of the Commission have expressed differing personal views on the proper interpretation of this term, see Public Service Commission of the State of New York v. Federal Power Commission, 543 F.2d 757, 777-78 (D.C. Cir. 1974). It is the Commission's institutional responsibility as an adjudicatory body, 29 U.S.C. § 651(b)(3), to apply precedent unless overruled or distinguished, see Atchison, Topeka & Santa Fe Railway Co. v. Wichita Board of Trade, 412 U.S. 800, 808 (1973); Secretary of Agriculture v. United States, 347 U.S. 645 (1954); Local 777, Democratic Union Organizing Committee Seafarers Int'l Union of North America v. NLRB, 603 F.2d 862, 894 (D.C. Cir. 1978), and to interpret the applicable legal requirements in the context of factual controversies.

Sun Ship #16118

ROWLAND, Chairman, dissenting:

During the more than ten years that the noise standard has been in effect, this Commission has been unable to interpret and apply it in a consistent, reasonable manner. This decision, which represents the Commission's latest attempt to define the meaning of the term "feasible," is no exception. Relying on a Supreme Court decision[1/] that is not dispositive of the issue at hand, the majority concludes that "feasible" has the "plain meaning" of "achievable," and that the noise standard therefore requires employers to spend large sums of money to reduce noise levels regardless of whether such expenditures produce any commensurate benefits in employee safety or health. Moreover, the majority's interpretation preempts a rulemaking decision that the Secretary of Labor is statutorily empowered to make, and indeed is in the process of making. In my opinion, the inability of the Commission to arrive at a consistent interpretation of the standard, coupled with the absence of any legislative history concerning the meaning "feasible" was intended to have in the standard, demonstrates that the standard lacks ascertainable criteria for its enforcement and impermissibly delegates to the Commission the authority to decide what the standard should mean. I therefore conclude that the standard is unenforceable to the extent it seeks to require "feasible administrative or engineering controls" and would vacate the citation issued to Sun Ship in this case on this basis.

I

It is a fundamental principle that a statute or regulation is unenforceable if its terms are so uncertain of meaning as to result in arbi-

---

1/ American Textile Manufacturers Institute v. Donovan, 101 S.Ct. 2478 (1978) ("ATMI").

trary and discriminatory enforcement. Grayned v. City of Rockford, 408 U.S. 104 (1972); Giaccio v. State of Pennsylvania, 382 U.S. 399 (1966); International Society for Krishna Consciousness of Atlanta v. Eaves, 601 F.2d 809 (5th Cir. 1979). As the Supreme Court said in Grayned v. City of Rockford, supra:

> [I]f arbitrary and discriminatory enforcement is to be prevented, laws must provide explicit standards for those who apply them. A vague law impermissibly delegates basic policy matters to policemen, judges, and juries for resolution on an ad hoc and subjective basis, with the attendant dangers of arbitrary and discriminatory application.

408 U.S. 108-09 (footnotes omitted). Examining the nexus between unenforceably vague statutory terms and the non-delegation doctrine, Justice Rehnquist observed in his concurring opinion in Industrial Union Department, AFL-CIO v. American Petroleum Institute, 448 U.S. 607, 100 S.Ct. 2844 (1980) ("IUD v. API"):

> As formulated and enforced by this Court, the non-delegation doctrine serves three important functions. First, and most abstractly, it ensures to the extent consistent with orderly governmental administration that important choices of social policy are made by Congress, the branch of our government most responsive to the popular will. See Arizona v. California, 373 U.S. 546, 626 (1963) (Harlan, J., dissenting in part); United States v. Robel, 389 U.S. 258, 276 (1967) (Brennan, J., concurring in the result). Second, the doctrine guarantees that, to the extent Congress finds it necessary to delegate authority, it provides the recipient of that authority with an "intelligible principle" to guide the exercise of the delegated discretion. See Hampton & Co. v. United States, 276 U.S. 394, 409 (1928); Panama Refining Co. v. Ryan, 293 U.S. 388, 430 (1935). Third, and derivative of the second, the doctrine ensures that courts charged with reviewing the exercise of delegated legislative discretion will be able to test that exercise against ascertainable standards. See Arizona v. California, supra, at 626 (Harlan, J., dissenting in part); American Power & Light Co. v. SEC, 329 U.S. 90, 106 (1946).

100 S.Ct. at 2885-86. Justice Rehnquist's observation that Congress "must provide sufficient principles to guide an agency as to the limits of its delegated discretion," is equally applicable to agency promulgation of standards. Accordingly, where an agency exercises Congressionally-delegated authority to promulgate standards, the agency must write the standards in reasonably explicit terms so that the adjudicators under those standards have principles to guide their findings and conclusions.

In attempting to interpret the noise standard, individual Commission members have held greatly divergent views about the meaning of "feasible" and ultimately the Commission has not been able to adhere to an interpretation. Instead, each time the Commission has examined the issue, its members came to different conclusions. In Continental Can Co.,[2/] a Commission majority agreed that "[i]n determining whether controls are economically feasible, all relevant cost and benefit factors must be weighed." 4 BNA OSHC at 1547, 1976-77 CCH OSHD at p. 25,256. The majority noted that the Secretary would only allow consideration of economic factors if the cost of implementing controls would seriously jeopardize the financial health of a company[3/] and stated that this ap-

---

2/ 76 OSAHRC 109/A2, 4 BNA OSHC 1541, 1976-77 CCH OSHD ¶ 21,009 (No. 3973, 1976), appeal withdrawn, No. 76-3229 (9th Cir. Apr. 26, 1977) ("Continental Can").

3/ Engineering controls to reduce noise levels can be very expensive. A study prepared for OSHA in the early 1970's projected that the cost of achieving the 90 dBA 8-hour time weighted average limit of the noise standard using engineering controls would be about $13.5 billion. 1973-74 CCH Developments ¶ 9126. And, since that time, inflation has undoubtedly increased the cost considerably. In contrast, according to OSHA's preamble to the new hearing conservation standard, 46 Fed. Reg. 4078, 4117-18 (1981),

(continued on next page)

proach is unreasonable because it compels employers to expend considerable sums of money for protection against a hazard that is not life threatening:

> Clearly, employers have finite resources available for use to abate health hazards. And just as clearly if they are to be made to spend without limit for abatement of this hazard their financial ability to abate other hazards, including life threatening hazards, is reduced. We can conceive that in some if not many cases it will be reduced to the point that they will be put in financial jeopardy when faced with the problem of abating a life threatening hazard.

4 BNA OSHC 1547, 1976-77 CCH OSHD at p. 25,256. Thus, the Continental Can majority saw that it is entirely unreasonable to hold that "feasible" means simply "achievable" or "capable of being done." The courts that reviewed decisions concerning alleged violations of the noise standard accepted the Continental Can majority's interpretation. Donovan v. Castle & Cooke Foods, No. 77-2565 (9th Cir. Nov. 19, 1982); RMI Co. v. Secretary, 594 F.2d 566 (6th Cir. 1979); Turner Co. v. Secretary, 561 F.2d 82 (7th Cir. 1977). See also Diversified Industries Division, Independent Stave Co. v. OSHRC, 618 F.2d 30 (8th Cir. 1980); Marshall v. West Point Pepperell, 588 F.2d 979, 981 n.3 (5th Cir. 1979).

The Commission has never until now overruled the Continental Can interpretation, but the two Commission members who form the majority in this case certainly wanted to, and were only prevented from doing so

---

3/ (continued)

the cost of a hearing protection program meeting the requirements of the new standard is expected to be, at most, $270 million.

The cost of engineering controls obviously will fall unevenly on different industries and different employers within an industry. Thus, there is a very real possibility that the costs associated with engineering controls will jeopardize the financial health of particular employers or even of entire industries.

through their inability to agree on a new interpretation. Commissioner Cleary first described his views in his dissenting opinion in Continental Can. There he said, "Economic considerations are not implicit in the term 'feasible' as it appears in section 1910.95(b)(1)" (emphasis in the original) and "Cost considerations are relevant only in determining the pace at which an abatement program should proceed." 4 BNA OSHC at 1550, 1976-77 CCH OSHD at p. 25,259. Thus, Commissioner Cleary took the view that "feasible" means technologically achievable and nothing more. As technology develops, employers must implement it, without regard to costs and benefits. Commissioner Cottine later agreed with this position in Samson Paper Bag Co., 80 OSAHRC 60/A2, 8 BNA OSHC 1515, 1980 CCH OSHD ¶ 24,555 (No. 76-222, 1980) (concurring opinion), but Commissioner Cleary then decided, having given the matter further thought, that economics plays some role in determining whether controls are feasible. According to Commissioner Cleary, the standard "should not force an employer into an abatement situation that, from an economic standpoint, is patently unreasonable." 8 BNA OSHC at 1525, 1980 CCH OSHD at p. 30,048. However, he rejected weighing the costs against the benefits as the test of economic feasibility, saying that the OSH Act does not require a reasonable balance of costs and benefits.

Thus, over about four years there were three widely diverging and strongly held views expressed by Commission members about the meaning of "feasible": one requiring cost-benefit analysis, another prohibiting any consideration of economic factors, and a third permitting consideration of economic factors under a vaguely defined "reasonableness" test.

The current Commission majority adopts a fourth view. As part of the Secretary's proof of feasibility, the Secretary must show "either that the cost of engineering and administrative controls will not threaten the cited employer's long-term profitability and competitiveness or that the employer's inability to afford the cost of controls results from the employer lagging behind its industry in providing safety and health protection for employees."[4/]

II

Accepting the Secretary's arguments, the majority bases its interpretation of the noise standard on ATMI, in which the Supreme Court decided that "feasible" means simply "capable of being done" or "achievable."[5/] However, in ATMI the Supreme Court was faced only with the narrow question of interpreting section 6(b)(5) of the OSH Act, which deals with the promulgation of standards for toxic substances and harmful physical agents. See notes 3 and 6 of the majority opinion. See also 101 S.Ct. at 2489. The

---

4/ Although they agree on this broad, general test, it appears that Commissioners Cleary and Cottine do not agree on how the test is to be applied. Commissioner Cleary specifies numerous factors that may be considered in such inquiry, and it is not clear whether Commissioner Cottine considers those factors relevant. See notes 12 and 13 of the lead opinion. Moreover, the wide range of factors Commissioner Cleary would consider provide a further demonstration that "feasible" can mean whatever a person wants it to mean. As Justice Rehnquist stated, "feasible" is a "legislative mirage . . . assuming any form desired by the beholder." IUD v. API, 100 S.Ct. at 2883 (concurring opinion).

5/ In this case, the Secretary argues that the Court's interpretation of "feasible" as it appears in § 6(b)(5) rulemaking should be applied to the judicial interpretation of the noise standard, promulgated under § 6(a). However, in another case, the Secretary has argued to the Commission that the "significant risk" test for § 6(b)(5) standards established by the Supreme Court in IUD v. API should not be applied to the interpretation and application of standards because that decision of the Court applies only to rulemaking, and not adjudication. See Pratt & Whitney Aircraft, 10 BNA OSHC 2011, 1982 CCH OSHD ¶ 26,257 (No. 13591, 1982), appeal filed, No. 82-4180 (2d Cir. Nov. 16, 1982).

Court unequivocally stated in ATMI that it did not decide whether costs and benefits can be weighed in promulgating standards under other provisions of the OSH Act or to establish priorities among possible standards for rulemaking proceedings. 101 S.Ct. at 2490 n. 29 and 2493 n. 32. See Donovan v. Castle & Cooke Foods, slip op. at 12. Thus, ATMI does not answer what role costs and benefits can play in a standard adopted under section 6(a).

Additionally, the Court's "plain meaning" definition of "feasible" cannot be uncritically applied wherever the term is found. The Court closely examined the legislative history of section 6(b)(5) to assure that the Congressional intent in inserting "feasible" into the section corresponded with what the Court said was the "plain meaning" of the term. See 101 S.Ct. at 2490-94. Accordingly, although the meaning of section 6(b)(5) of the OSH Act is now clear from ATMI, the meaning of the noise standard remains an unanswered question.

Interpreting the noise standard presents different and special problems. Because the noise standard was adopted under section 6(a) of the OSH Act as an established federal standard in effect under the Walsh-Healey Act,[6/] the standard must be given the same meaning under the OSH Act that it had under the Walsh-Healey Act, for the Secretary was generally not empowered to effect any substantive change in adopting standards under section 6(a) of the OSH Act. American Can Co., 82 OSAHRC 5/A2, 10 BNA OSHC 1305, 1982 CCH OSHD ¶ 25,899 (No. 76-5162, 1982); George C. Christopher & Sons, Inc., 82 OSAHRC , 10 BNA OSHC 1436,

---

6/ See note 7 of the majority opinion.

1982 CCH OSHD ¶ 25,956 (No. 76-647, 1982), citing Diebold, Inc. v. OSHRC, 585 F.2d 1327, 1332 (6th Cir. 1978); cf. Noblecraft Industries, Inc. v. Secretary, 614 F.2d 199 (9th Cir. 1980). But nowhere in the Walsh-Healey Act, its legislative history, or the standards adopted under the statute is there any indication what "feasible" meant under Walsh-Healey. Accordingly, unlike section 6(b)(5) of the OSH Act, for the Walsh-Healey noise standard there is no legislative support for interpreting "feasible" as simply "achievable."

In the absence of any ascertainable criteria to guide the enforcement of a standard, any interpretation given by the Commission is derived, not from the standard, but from the Commission majority's own views of what the standard should say.[7/] Such an interpretation is impermissible for any standard, but particularly for one that, like the noise standard, may impose enormous costs on industry to protect against a hazard that is not life-threatening.[8/] The policy decisions that must be made in such a

---

7/ See Continental Can Co., 4 BNA OSHC at 1546-47 and n. 14, 1976-77 CCH OSHD at p. 25,255 and n. 14. Having recognized that the legislative history of the standard provided no guidance as to the role economic considerations were to play, the majority in Continental Can proceeded to hold that the standard required a balancing of costs and benefits. Although I believe such an interpretation is "reasonable," the Commission cannot create an interpretation of a standard that has no basis in the language and intent of the standard. As I have noted, it is the duty of the congressionally delegated authority, in this case the Secretary, to provide ascertainable criteria by which standards can be interpreted and applied. To hold otherwise would mean that the Commission, not the Secretary, is setting the standard, and would constitute an impermissible delegation of the Secretary's rulemaking authority. Thus, although I believe that the Continental Can interpretation was reasonable, I also believe that the majority's analysis in Continental Can supports the conclusion that the standard is unenforceable.

8/ The abatement of many life-threatening hazards involves costs far less than those at stake in implementing engineering controls for noise. For

(continued on next page)

situation should be made in rulemaking, in which all persons affected by the standard have an opportunity to be heard. Indeed, the Secretary is currently engaged in a rulemaking proceeding aimed at determining the degree to which administrative or engineering controls must be used to protect against excessive noise.[9/] It is incongruous for the Commission to

---

8/ (continued)

example, OSHA estimated the cost of engineering controls for cotton dust at $543 million. ATMI, 101 S.Ct. at 2498. OSHA believed that the cost of such controls for benzene would be $266 million. IUD v. API, 100 S.Ct. at 2857. The cost of engineering controls for lead, to be implemented by primary and secondary smelters, battery manufacturers, and the paints and coatings industry, OSHA projected to be between approximately $337 and 395 million. United Steelworkers of America, AFL-CIO-CLC v. Marshall, 647 F.2d 1189, 1278-1303 (D.C. Cir. 1980), cert. denied, 101 S.Ct. 3148 (1981). And OSHA estimated that the costs for compliance with the coke oven emissions standard would be between $240 and 1,280 million. American Iron & Steel Institute v. OSHA, 577 F.2d 825, 836 (3d Cir. 1978), cert. dismissed, 448 U.S. 917 (1980).

The costs associated with abating these life-threatening hazards have been subjected to intense scrutiny in administrative rulemaking and in judicial review of the rulemaking actions. In contrast, the potentially much greater costs associated with engineering controls for noise, see note 3 supra, were apparently not considered before section 1910.95(b)(1) was promulgated under the Walsh-Healey Act and the policy decisions that Congress intended should be made before such costs are imposed on industry have not been made or scrutinized in any forum.

9/ In 1972, pursuant to authority granted by 29 U.S.C. §§ 669(a) and 671(d), the National Institute for Occupational Safety and Health ("NIOSH") developed a criteria document on noise exposure recommending that the Secretary study the feasibility of reducing the permissible time weighted exposure level to 85 dBA. In 1973, pursuant to authority granted by 29 U.S.C. § 656(b), the Assistant Secretary of Labor for Occupational Safety and Health appointed an Advisory Committee on Noise to receive and evaluate the views of labor, management, government, and independent experts in noise problems and make recommendations to OSHA for a revised noise standard. In late 1973, the Advisory Committee transmitted its report to OSHA and, during the first nine or ten months of 1974, OSHA considered the information and recommendations contained in the NIOSH criteria document and the Advisory Committee's recommendations, as well as other available information. 46 Fed. Reg. 4102-4103. Then, on October 24, 1974, OSHA proposed a revision to the

(continued on next page)

apply the Supreme Court's section 6(b)(5) definition of "feasible" to the current standard's requirement for administrative and engineering controls when the Secretary is considering in rulemaking the circumstances under which such controls are "feasible" within the meaning of section 6(b)(5).

The extent of this incongruity is demonstrated by examining the nature of the policy decisions the Secretary must make in determining whether administrative and engineering controls are feasible within the meaning of section 6(b)(5). As noted above, note 3 supra, one report prepared for the Secretary calculated that the cost of achieving 90 dBA in all workplaces would approximate $13.5 billion, unadjusted for the inflation that has occurred in the past several years. The report also states that the cost of achieving the 85 dBA limit of the hearing conservation standard through engineering controls would approximate $31.6 billion, also unadjusted for inflation. The Secretary must consider the impact these costs will have on each industry affected by the standard, taking into account all the complex and critical factors listed by Commissioner Cleary in his separate remarks in this case. He must determine whether different requirements should be imposed on different industries either because the nature of the

---

9/ (continued)

noise standard and solicited comments and objections. 39 Fed. Reg. 37773-37778. Subsequently, the comment period was extended several times because of the complexity of the issues and over the next several years, two informal hearings were held. See 46 Fed. Reg. 4103-04 (summarization of notices and proceedings). These proceedings resulted in the hearing conservation amendment to the noise standard and OSHA's solicitation of further information about revision of the noise standard's current requirement for the use of "feasible" engineering and administrative controls. See 46 Fed. Reg. 4105.

hazard differs between industries or because certain industries cannot afford to achieve noise levels that other industries can, and perhaps already have, obtained. See AFL-CIO v. Marshall, 617 F.2d 825 (D.C. Cir. 1979); see also 39 Fed. Reg. 43802 (Environmental Protection Agency's comments in the Secretary's rulemaking proceeding). He must consider whether a requirement for administrative or engineering controls should be phased in over a period of time, or whether different industries should be given different periods for compliance. The difficulty of making these determinations is illustrated by the fact that the Secretary has been unable to adopt a final standard in the approximately ten years he has had the issue under consideration.[10/]

None of the factors bearing on economic feasibility under section 6(b)(5) were considered when the Secretary promulgated the present standard under the Walsh-Healey Act, and were also not considered when the Secretary followed the summary procedure for adopting that standard under the OSH Act. See Continental Can Co., 4 BNA OSHC at 1547, 1976-77 CCH OSHD at p. 25,256. The Secretary simply required that engineer-

---

10/ In this case, the Secretary contends that Sun Ship violated section 1910.95(b)(1) by exposing a single employee to excessive noise and by failing to implement engineering controls for the equipment that employee was using. However, the interpretation established in this case will control the disposition of more than twenty other cases now before the Commission. Many of those cases will have implications for the types of noise controls required in entire industries. E.g., Cox Enterprises, Docket No. 12074 (newspaper industry); Pabst Brewing Co., Docket No. 13068 and 77-1895 (beverage packaging); Plum Creek Lumber Co., Docket No. 78-1753 (sawmill operations); Deering-Milliken, Inc., Docket Nos. 12598 and 13037 (textile manufacturing); Southwest Forest Industries, Docket No. 78-3976 (corrugated paperboard manufacturing); Sherwin Williams, Inc., Docket No. 14131 (can manufacturing). Therefore, although this case has relatively simplistic facts, its decision will have a broad impact on numerous industries, and it is necessary to consider that impact in deciding this case.

ing or administrative controls be implemented if "feasible," without providing ascertainable criteria by which the meaning of "feasible" could be determined. Indeed, the Secretary's very purpose in using the word "feasible" was probably to avoid establishing ascertainable criteria and to leave the interpretation of the word for a later day.

I recognize that, to this time, no court which has considered the noise standard has decided that it impermissibly delegates to the Commission the unbounded authority to establish criteria for its enforcement. Donovan v. Castle & Cooke Foods, supra; RMI Co. v. Secretary, supra; Turner Co. v. Secretary, supra; see also Diversified Industries Division, Independent Stave Co. v. OSHRC, supra. But the interpretation before these courts for their consideration was that set forth by the Commission in Continental Can, which represented a good faith attempt to give genuine significance to costs of compliance with the noise standard.[11/] The Commission had not yet issued the decisions in Samson Paper Bag Co., supra, or this case, which so graphically illustrate that the word "feasible" can mean whatever an individual adjudicator wants it to mean. Because the Commission majority has now retreated from Continental Can at the urging of the Secretary, and has substituted

---

11/ In Donovan v. Castle & Cooke Foods, the Ninth Circuit concluded that the Supreme Court's decision in ATMI did not preclude a weighing of costs and benefits in the enforcement of a § 6(a) standard. The Ninth Circuit therefore accepted the Commission's interpretation of § 1910.95(b)(1) because that interpretation was not unreasonable, arbitrary, or inconsistent with the Act. Slip op. at 13. I agree with the Ninth Circuit that ATMI does not preclude a weighing of costs and benefits in interpreting a § 6(a) standard. However, as I have explained above, the enforcement of any standard must be consistent with the regulatory intent underlying the standard. The Commission is not free to fill a regulatory void by supplying its own interpretation of a standard lacking in regulatory intent, no matter how reasonable that interpretation may be.

an unworkable test consisting of elements which the majority itself cannot clearly define, I conclude that the requirement of section 1910.95(b)(1) to abate by use of "feasible" controls must be considered unenforceable.

III

Nobody can deny that protection against excessive noise is necessary. However, it is not necessary to enforce the requirement for "feasible administrative or engineering controls" in section 1910.95(b)(1) to provide employees with such protection. The requirement of the Secretary's new hearing conservation standard that employees be protected against excessive noise levels by personal protective equipment remains in force.[12/] Indeed, in this case the employee allegedly exposed to

---

12/ The hearing conservation standard requires employers to ensure that all employees exposed to noise levels in excess of those listed in Table G-16 wear personal hearing protectors. In addition, employers must make hearing protectors available to employees exposed to time weighted average noise levels greater than 85 dBA, and must ensure that employees exposed to such noise levels who have experienced a permanent significant threshold shift in their hearing ability wear such protectors. 29 C.F.R. § 1910.95(1).

Properly used, personal protective equipment is capable of as much as a 20 to 30 dB attenuation in existing noise levels, see 46 Fed. Reg. at 4111 (1981), and can reasonably be expected to produce a 10 to 15 dB attenuation, see 46 Fed. Reg. 4113-14. Of course, the effectiveness of personal protective equipment depends on its correct use and, therefore, personal protective equipment is generally regarded as inferior to engineering controls. See Continental Can Co., supra; Turner Co., 76 OSAHRC 108/A2, 4 BNA OSHC 1554, 1976-77 CCH OSHD ¶ 21,023 (No. 3635, 1976), remanded, 561 F.2d 82 (7th Cir. 1977); see generally 46 Fed. Reg. at 4078, 4113, 4114. However, in the hearing conservation amendment to the noise standard, OSHA prescribes a program for effective use of personal protective equipment. The employer is required to make available a variety of suitable protective devices, to insure their proper fit, and to train and supervise employees in the proper use and care of hearing protectors. Detailed instructions

(continued on next page)

excessive noise was wearing swedish wool earplugs, and there is no allegation that this equipment was being improperly used.

The Secretary has been considering, in rulemaking, the circumstances in which engineering or administrative controls shall be required to supplement the protection afforded by the hearing conservation standard. The question requires the Secretary to consider a number of complex issues, including the significance of the risk to employees despite the provisions of the hearing conservation standard and the economic feasibility of controls for all industries and industry segments affected by the standard. By their decision in this case, however, the majority short-circuits the statutory rulemaking process and decides that engineering or administrative controls must be implemented regardless of the efficacy or use of personal protective equipment. The majority further holds that the numerous and complex factors affecting the ability of employers to afford the cost of controls, factors that are peculiarly suited to consideration in rulemaking, must be addressed on a case-by-case basis in adjudication.

---

12/ (continued)

are also prescribed for evaluating the degree of noise attenuation which will be achieved by protective equipment. Presumably, the program can be successfully implemented. Moreover, engineering controls can also be used ineffectively and can become progressively less effective from wear and abuse. For example, removable barriers or enclosures can be circumvented, left out of place, or damaged by employees. See Ormet Corp., 81 OSAHRC 35/C3, 9 BNA OSHC 1828, 1981 CCH OSHD ¶ 25,322 (No. 76-4398, 1981) (employees deliberately damaged a locking clasp on a main electrical disconnect switch so that they could use it as an on-off switch); MRS Printing, Inc., 78 OSAHRC 84/B10, 6 BNA OSHC 2025, 1978 CCH OSHD ¶ 23,102 (No. 76-3113, 1978)) (employee circumvented dual controls activating a guillotine cutter by tripping the left hand lever with his left knee, leaving his left hand free while the blade was activated by his right hand). Thus, engineering controls, too, involve human elements that can undermine the protection.

Thus, instead of the Commission applying ascertainable criteria established when the standard was promulgated, each Commission proceeding on a noise citation will become a mini-rulemaking proceeding. But because the record made in a proceeding before the Commission cannot possibly permit an intelligent evaluation of the factors the Secretary must consider in rulemaking, such Commission proceedings will inevitably result in arbitrary and unequal enforcement of the standard. Given the absence of any legislative history of the standard establishing ascertainable criteria for its enforcement, I would hold that the requirement for feasible engineering and administrative controls is unenforceable. I would leave the issue of when such controls should be required for the Secretary to resolve in rulemaking, the forum in which Congress intended such questions to be resolved.

UNITED STATES OF AMERICA

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

|---|---|---|
| SECRETARY OF LABOR | : | |
| Complainant | : | |
| v. | : | DECISION AND ORDER |
| SUN SHIPBUILDING & DRYDOCK CO. | : | OSHRC Docket No. 16118 |
| Respondent | : | |

APPEARANCES

FOR THE SECRETARY OF LABOR

Marshall H. Harris, Regional Solicitor
Attn: Howard K. Agran, Esq.
U. S. Department of Labor

FOR THE RESPONDENT

Pepper, Hamilton & Scheetz
Attn: Kenneth L. Oliver, Esq.
J. Anthony Messina, Esq.

Brennan, W. E.; A.L.J.

This action arises under the provisions of Section 10(c) of the Occupational Safety and Health Act of 1970, 29 U.S.C. 659(c) (hereinafter the Act), to review a Citation for nonserious violations of Section 5(a)(2) of the Act, 29 U.S.C. 654(a)(2) and penalties proposed thereon issued pursuant to Sections 9(a) and 10(a) of the Act, 29 U.S.C. 658(a) and 659(a) by the Secretary of Labor through the Area Director of the Occupational Safety and Health Administration for Philadelphia, Pennsylvania (hereinafter Complainant), to Sun Shipbuilding and Drydock Company (hereinafter Respondent), following an inspection of Respondent's shipyard located at the foot of Morton Avenue, Chester, Pennsylvania (hereinafter work site).

Between July 31, 1975, and September 30, 1975, three Industrial Hygienists - Compliance Officers (Clark, Dubin and Crenshaw), made an industrial hygiene inspection of Respondent's work site. As a result of that inspection, Respondent, on November 26, 1975, was issued a Citation alleging nonserious violations of Section 5(a)(2) of the Act, 29 U.S.C. 654(a)(2) for failure to comply with the Occupational Safety and Health Standards (hereinafter Standards) codified at 29 C.F.R. 1910.95, (Item No. 1) and 29 C.F.R. 1910.1000 (Item No. 2), as well as a Notification proposing a total penalty of $60 based upon Item No. 2[1/] (R.pp. 1, 2).

[1/] During the trial herein, without objection, the Notification of Proposed Penalty was amended, to reflect Complainant's true intention, to wit, to propose the $60 penalty for the alleged noise violation, Item No. 1, and no penalty for Item No. 2 (Tr. Vol. IV, p. 20).

A timely notice of contest to both Items of the Citation was filed by Respondent, through its counsel, pursuant to Section 10(c) of the Act, 29 U.S.C. 659(c) (R.p. 3).

After the filing of a Complaint (R.p. 6) and Answer (R.p. 8), this case was originally set down for trial for March 24, 1976 (R.p. J-1).

Item No. 1 of the instant Citation involved the so called "noise" Standard, 29 C.F.R. 1910.95, and Item No. 2, the Air Contaminant Standard, 29 C.F.R. 1910.1000, and there ensued rather protracted pretrial procedures involving a reinspection of Respondent's work site and discovery procedures (R.pp. J-2 through J-25).

On August 24, 1976, the Review Commission issued its Decision in the case of Sec. of Labor v. Continental Can Company, Inc., OSHRC Docket No. 3973, et al., which involved the noise Standard (29 C.F.R. 1910.95), and significantly altered the burden of proof of the parties to such a type of case. A further delay in this trial was occasioned awaiting the Complainant's decision on whether to appeal the Continental Can case to an appropriate U. S. Court of Appeals (R.pp. J-26 through J-32). It was finally decided that any further delay of this trial pending the appeal in the Continental Can case was not warranted, and the trial was finally convened pursuant to written notice on January 12, 1977, concluding on the fifth day, with an intermittent recess, on March 10, 1977 (R.pp. J-32 through J-35). Both parties were represented by counsel. No affected employees or representatives thereof desired party status (Tr. Vol. I, p. 6). Post-trial briefs were finally received from both parties on May 23, 1977 (R.pp. J-50, J-51).

Having considered the entire record herein, the testimony and demeanor of the witnesses, the exhibits, stipulations, representations, admissions and arguments of the parties, it is concluded that the substantial, reliable and probative evidence of this record considered as a whole supports the following findings of fact and conclusions of law.

The citation as issued herein, set forth the following information:

Item No. 1

Description of Alleged Violation

> 29 C.F.R. 1910.95 - Employees, in the following locations, were subjected to sound levels which exceeded the permissible exposures listed in Table G-16 of this section, and their exposures were not limited in accordance with the requirements of 29 CFR 1910.95(b)(1). The sound levels were obtained at the hearing zone of the employees:
>
> a) Shot Blast Building — shot blast operator
>
> b) Building No. 42, Blacksmith Shop -- blacksmith (grinding hatch opening rings and blacksmithing)
>
> Employees at the preceding locations, 'a' and 'b', were subjected to sound levels for which the exposure fraction Cn/Tn (see Table G-16, Note #1) exceeded 1.0.
>
> c) Building No. 30, Boiler Shop -- arcair operator
>
> Employee at the preceding location, 'c', was subjected to sound levels in excess of 115 dBA.

Abatement was ordered in accordance with a specific timetable set forth in the Citation, and a total penalty of $60, not allocated to any of the three specified locations, was intended to be proposed (see fn. 1/, supra).

Item No. 2

Description of Alleged Violation

> 29 C.F.R. 1910.1000 - Employees, in the following locations, were exposed to material listed in Table Z-1 of this section,

and their exposures were not limited in accordance with the requirements of 29 CFR 1910.1000 (a)(2), (d)(1) and (e). Samples were obtained at the breathing zone of the employees:

a) Building No. 30, Boiler Shop -- arcair operator

Employees at the preceding location, 'a', were exposed to iron oxide fume concentrations in excess of 10 $mg/M^3$ (eight-hour time-weighted average).

Abatement was ordered in the same fashion as under Item No. 1, and no penalty was intended to be proposed (R.pp. 1, 2).

The cited Standards provide:

Item No. 1

29 C.F.R. 1910.95

Occupational Noise Exposure

(a) Protection against the effects of noise exposure shall be provided when the sound levels exceed those shown in Table G-16 when measured on the A scale of a standard sound level meter at slow response. When noise levels are determined by octave band analysis, the equivalent A-weighted sound level may be determined as follows:

(b)

(1) When employees are subjected to sound exceeding those listed in Table G-16, feasible administrative or engineering controls shall be utilized. If such controls fail to reduce sound levels within the levels of Table G-16, personal protective equipment shall be provided and used to reduce sound levels within the levels of the table.

Table G-16 - Permissible Noise Exposures[1/]

| Duration per day, hours | Sound level dBA slow response |
|---|---|
| 8 | 90 |
| 6 | 92 |
| 4 | 95 |
| 3 | 97 |
| 2 | 100 |
| 1-1/2 | 102 |
| 1 | 105 |
| 1/2 | 110 |
| 1/4 or less | 115 |

(Footnote 1 omitted)

Exposure to impulsive or impact noise should not exceed 140 dB peak sound pressure level.

(2) If the variations in noise level involved maxima at intervals of 1 second or less, it is to be considered continuous.

(3) In all cases where the sound levels exceed the values shown herein, a continuing, effective hearing conservation program shall be administered.

Item No. 2

29 C.F.R. 1910.1000

Air Contaminants

An employee's exposure to any material listed in table Z-1, Z-2, or Z-3 of this section shall be limited in accordance with the requirements of the following paragraphs of this section.

(a) Table Z-1: * * *

(2) Other materials--8-hour time weighted averages. An employee's exposure to any material in table Z-1, the name of which is not preceded by 'c', in any 8-hour work shift of a 40-hour work week, shall not exceed the 8-hour time weighted average given for that material in the table.

Table Z-1

| Substance | p.p.m. | mg./$M^3$ |
|---|---|---|
| * * * | | |
| Iron Oxide Fume | --- | 10 |
| * * * | | |

(e) To achieve compliance with paragraph (a) through (d) of this section, administrative or engineering controls must first be determined and implemented whenever feasible. When such controls are not feasible to achieve full compliance, protective equipment or any other protective measures shall be used to keep the exposure of employees to air contaminants within the limits prescribed in this section. Any equipment and/or technical measures used for this purpose must be approved for each particular use by a competent industrial hygienist or other technically qualified person. Whenever respirators are used, their use shall comply with § 1910.134.

The following matters were stipulated to by the parties at the outset of trial.

Exhibit C-1 was admitted into evidence (Tr. Vol. I, p. 7). Samples of the iron oxide contaminant obtained during the inspection of Respondent's work site were sent to the National Institute's Occupational Safety and Health analytical laboratory at Salt Lake City, Utah, where they were analyzed by Chemist Edward F. Zimowski. Exhibit C-1 sets forth the substance of this chemist's testimony if he were produced as a witness, i.e., the receipt of the samples, the method used to analyze them, and the results of this analysis. These samples were found to contain iron oxide in excess of the 10 $mg/M^3$[2/] limit set forth in the Standard, to wit; 23.4, 20.3, 27.2 and 19.9 $mg/M^3$ (see Exhibit C-1, p. 3). This exhibit obviated the need to call this chemist and relates to Item No. 2 of the Citation.

Exhibit C-2, as amended by counsel at trial, was also admitted into evidence (Tr. Vol. I, pp. 7-12).

This exhibit involves Item 1(a) of the Citation, wherein, it is alleged that the shotblast operator, working in a shotblast building at the work site, was exposed to sound levels which exceeded the allowable levels set forth in the cited Standard, 29 C.F.R. 1910.95, supra.

At the close of the Complainant's case, Respondent moved for the dismissal of the Citation. During argument on that motion, Item 1(a) of the Citation was found to have been established by the stipulation, Exhibit C-2. Because Respondent had implemented two of the three

---

[2/] 10 $mg/M^3$ translates to 10 milligrams (of iron oxide) per cubic meter of air.

engineering controls suggested by Complainant in his reinspection of the work site thereby evidencing its good faith, it was concluded that no penalty (or portion of the $60 penalty proposed for all the alleged noise violations, Items 1(a), 1(b) and 1(c)), should be assessed (Tr. Vol. V, pp. 38-62). That ruling is hereby confirmed.

Further, at the beginning of trial, Complainant moved to vacate Item 1(c) of the Citation, on the ground that there exists no known engineering technology to reduce employee exposure who are arcairing[3/] to permissible levels as set forth in Table G-16 of the noise Standard. This motion was granted, which ruling is hereby confirmed (Tr. Vol. I, pp. 12, 13).

Thus, at the outset of trial, there remained for resolution the one remaining alleged noise violation, Item No. 1(b), involving an employee located in Building No. 42 engaged in grinding hatch opening rings, with a hand held, pneumatic grinder, and Item No. 2, involving an employee in Building No. 30, the Boiler Shop, engaged in an arcairing operation and exposed to iron oxide fumes in excess of the limit permissible under the cited Standard.

It was additionally stipulated that Respondent is a Pennsylvania corporation with its principal office located at its shipyard in Chester, Pennsylvania. It purchases goods in excess of one million dollars a

---

[3/] Arcairing is a process of burning away unwanted metal. It is the opposite of welding. The arcair tool is hand held. It is fitted with various diameter carbon rods, which are electrically arced producing intense heat which melts the unwanted metal to a molten state. An air stream at high velocity (80 to 100 p.s.i.) moves through the tool and blows the molten metal away at appoximately 100 to 125 feet per second. The process is used to gouge out defective welds or to burn and blow away other types of unwanted metal from surfaces. The molten metal generates the iron oxide fumes at issue herein (Tr. Vol. III, pp. 90, 91; Vol. pp. 224-226).

year from sources without the State of Pennsylvania. No injuries are connected with this case. It is a large employer in its geographic area, with an average daily number of 4000 employees. Its gross annual sales exceed 100 million dollars (Tr. Vol. I, pp. 17-21, Vol. II, p. 97).

Based upon the foregoing, it is concluded that Respondent is an employer engaged in a business affecting commerce who has employees within the meaning of Sections 3(5) and (6) of the Act, 29 U.S.C. 652(5) and (6). Upon the filing of the Notice of Contest herein, the Review Commission has jurisdiction in this matter pursuant to Section 10(c) of the Act, 29 U.S.C. 659(c).

The first issue to be decided is Respondent's contention that it was improperly cited, in Item No. 2, for an alleged violation of the General Industry Standard codified at 29 C.F.R. 1910.1000 because the arcairing operation in process, which forms the factual basis of the allegation, involved shipbuilding and thus, a Maritime-Shipbuilding Standard, specifically 29 C.F.R. 1916.82(d)(1) should have been cited (see Respondent's Brief, pp. 3, 4, 13-15; R.p. J-50).

The General Industry Standard codified at 29 C.F.R. 1910.5, in pertinent part, provides as follows:

Applicability of Standards

* * *

(c)

(1) If a particular standard is specifically applicable to a condition, practice, means, method, operation, or process, it shall prevail over any different general standard which might otherwise be applicable to the same condition, practice, means, method, operation, or process. For example, § 1501.23(c)(3) of this title prescribes personal protective equipment for certain ship repairmen working in specified areas. Such a

standard shall apply, and shall not be deemed modified nor superseded by any different general standard whose provisions might otherwise be applicable, to the ship repairmen working in the areas specified in § 1915.23(c)(3).

(2) On the other hand, any standard shall apply according to its terms to any employment and place of employment in any industry, even though particular standards are also prescribed for the industry, as in Subpart B or Subpart R of this part, to the extent that none of such particular standards applies. To illustrate, the general standard regarding noise exposure in § 1910.95 applies to employments and places of employment in pulp, paper, and paperboard mills covered in § 1910.261.

Respondent argues that the Shipbuilding Standard codified at 29 C.F.R. 1916.82(d)(1),[4/] covers the activity here in question because the coverage of the Longshoremen and Harbor Workers Act (under which the Shipbuilding Standards were initially promulgated) has been judicially broadened under the recent case of Dravo Corp. v. Maxin, 545 F2d 374 (CA 3, 1976). Thus, the employee who was arcairing in Respondent's shipyard, although geographically removed from the "navigable waters of the U. S.," would be covered under the Dravo case, supra, and also thereby covered under the Shipbuilding Standard.

The solution to this issue, however, in my view, rests in determining the meaning of the above quoted "applicability" provisions of the General Industry Standards, 29 C.F.R. 1910.5(c)(1) and (2).

---

[4/] This Standard provides:

(d) Protection against particulate contaminants not immediately dangerous to life.

(1) When employees are exposed to unsafe concentrations of particulate contaminants, such as dusts and fumes, mists and fogs or combinations of solids and liquids, they shall be protected by either air line or filter respirators, except as otherwise provided in the regulations of this part.

Although the quoted provisions are far from a model of clarity, they appear to intend to make applicable to any given condition, the most specific Standard existent, whether a General Industry or particular industry standard regardless of where the alleged violative condition exists. Here, the General Industry Standard cited and relied upon by Complainant, 29 C.F.R. 1910.1000 is much more specific than the Shipbuilding Standard Respondent argues should apply. 1910.1000 makes reference to the specific offending air contaminant herein, iron oxide fume by name, and sets a specific employee exposure limit, 10 $mg/M^3$, whereas the Shipbuilding Standard is more general in its terms.

It is therefore concluded that the appropriate and more specific General Industry Standard is properly cited and relied upon herein and Respondent's argument is rejected.

The next issue raised is whether the remaining noise violation, Item 1(b), involving the grinding of hatch rings at Respondent's work site, is established by the evidence of record.

In order to determine this question, reference must be made to the decision of the Commission in its precedent case, Sec. of Labor v. Continental Can Company, Inc., OSHRC Docket No. 3973 et al. (August 24, 1976).

Chairman Barnako, speaking for the majority, in part,[5/] held that the Noise Standard, 29 C.F.R. 1910.95, "... requires only the implementation of those engineering controls which are economically, as well as

[5/] See "concurring" opinion of Commissioner Moran, p. 23, Slip opinion.

technically feasible." (p. 3, Slip opinion). In short, the Chairman defined the word "feasible" as it appears in the Noise Standard, to mean both "economically" and "technically" - feasible.

Further, the Chairman stated:

> "In determining whether controls are economically feasible, all the relevant cost and benefit factors must be weighed. ... any significant reduction in ambient noise levels which are above G-16 limits will tend to provide some protection to the hearing of employees. But we cannot overlook the fact that protection against most of the detrimental effects of excessive noise can be achieved through the use of a relatively reliable and convenient type of personal protective equipment. Additionally, the effects of exposure to continuous noise levels as high as 115 dBA is permitted by the standard itself.
>
> Other factors to be considered in the benefits which noise reduction will achieve include the number of employees exposed to excessive noise, and the net reduction in their exposure which engineering or administrative controls can reasonably be expected to produce. As to the last noted factor we would emphasize that the benefits to be obtained will vary according to the magnitude of the noise levels existing prior to the imposition of controls. Cost factors which must be considered include both the direct costs of installing and maintaining controls, and indirect costs due to any loss of productivity or efficiency resulting from their implementation. This list is not meant to be all-inclusive. We cannot here establish specific guidelines which will be applicable to all cases. The ultimate determination in each individual case must be made by weighing all the relevant factors in light of the objectives of the Act.
>
> The burden of proving that engineering or administrative controls are feasible lies with Labor. Love Box Co., OSHRC Docket No. 6286, BNA 4 OSHC 1138, CCH OSHD para. 20,588 (April 7, 1976); Reynolds Metals Co., OSHRC Docket No. 1551, BNA 3 OSHC 2051, CCH OSHD para. 20,447 (February 25, 1976).16/
>
> fn 16/ In Atlantic & Gulf Stevedores, Inc. v. OSHRC, [534 F2d 541 (3rd Cir., March 26, 1976)], the Court indicated that an employer could generally defend against an alleged violation of a standard by proving that the standard was not economically feasible as to him. The standard here at issue, unlike the one before the Court, explicitly requires only those engineering

and administrative controls which are feasible. Accordingly, proof of feasibility is an element of the charge, and must be borne by Labor. In Love Box Co. and Reynolds Metals Co., supra, Labor conceded that it had the burden of proving the feasibility of engineering or administrative controls."
(Slip opinion, pp. 18-20).

As of this writing, the Continental Can case has not been reviewed, reversed or modified by any U. S. Circuit Court of Appeals. It therefore constitutes Review Commission precedent which binds the undersigned and controls the determination of the issue stated, supra. Gindy Manufacturing Company v. Secretary of Labor, 10 OSAHRC 367, (May 7, 1974).

As Commissioner Cleary pointed out in his dissenting opinion in Continental Can, supra:

> "Perhaps the most disturbing aspect of the Chairman's holding is his placing of the burden of proving the economic feasibility of engineering controls upon the Secretary. This imposition is contrary to settled principles of law. More importantly, however, it places upon the Secretary a burden that is so onerous that it may be impossible to satisfy. As a necessary consequence, therefore, it will be virtually impossible for the Secretary to enforce the noise standard so as to assure the continuing development and implementation of technologically feasible engineering controls."[6/]
> (Slip opinion, pp. 35-36).

As to the case herein, and the issue stated, supra, the evidence of this record does not establish the alleged noise violation set forth in Item 1(b). Under the Continental case burden of proof, Complainant failed to introduce any evidence whatever concerning the "... indirect costs

---

[6/] I find myself in agreement with the compelling logic of Commissioner Cleary's well reasoned dissent in the Continental Can case, Slip opinion, pp. 24-37. Regretably, I am not free to follow it however.

due to any loss of productivity or efficiency resulting from...", the implementation of "technically" feasible engineering controls (i.e., a muffled air driven grinder and a wooden workbench), which the evidence does establish were available to this Respondent (see Tr. Vol. I, pp. 34-104, Exhs. R-1, R-2; pp. 113-202, Exhs. C-3, C-4, C-5, C-6).[7/] At the close of the Complainant's case, Respondent's motion to dismiss Item 1(b) was granted for the foregoing reasons (Tr. Vol. V, pp. 3-89). This ruling is hereby confirmed.[8/]

There remains for determination Item No. 2 of the nonserious Citation herein, which alleges that an arcair operator in Respondent's Boiler Shop, was exposed to iron oxide fumes in excess of the 10 $mg/M^3$ level set forth in the Air Contaminant Standard, 29 C.F.R. 1910.1000, and Respondent failed to determine and implement feasible engineering controls to reduce his exposure.

Paragraph (e) of the cited Standard provides:

> To achieve compliance with paragraph (a) through (d) of this section, administrative or engineering controls must first be determined and implemented whenever feasible. When such controls are not feasible to achieve full compliance, protective

---

[7/] This failure of evidence is quite understandable. I fail to understand how Complainant can produce such evidence absent a thorough and extensive cost analysis of all of Respondent's relevant financial, as well as production records, coupled with a thorough time and motion study of the noise operation both before and after the "technically" feasible engineering or administrative control. (Complainant might well have to resort to Section 8(b) of the Act, 29 U.S.C. 657(b) to accomplish this.) Even this type of evidence might well prove to be insufficient under Continental Can because the Chairman advises that the indicated "indirect costs," "... is not meant to be all-inclusive."

[8/] This determination is one example of what I conceive to be the accuracy and wisdom of Commissioner Cleary's cavaet in his dissenting opinion in the Continental Can case, quoted, supra.

equipment or any other protective measures shall be used to keep the exposure of employees to air contaminants within the limits prescribed in this section.

* * *

29 C.F.R. 1910.1000(e)

During trial, Respondent's counsel argued that the term "feasible" as it appears in the Air Contaminant Standard should be construed to mean what Chairman Barnako said "feasible" means in the Noise Standard (29 C.F.R. 1910.95) in the Continental Can case. (Tr. Vol. V, pp. 90-126).

This argument is rejected. In my view, the term "feasible" appearing in the Air Contaminant Standard means "practically possible of accomplishment under all of the circumstances of the case."[9/] (Tr. Vol. V, pp. 107, 127). "Feasible" is defined in Webster's New World Dictionary (The World Publishing Co., Second College Ed., 1974), as follows:

> 1. Capable of being done or carried out; practicable; possible. 2. Within reason, likely, probable. 3. Capable of being used or dealt with successfully; suitable.

Inherent in the foregoing definitions are concepts of both "technical" and "economic" feasibility. In my view, "economic" feasibility, i.e., the financial capacity of an employer to implement engineering or administrative controls, otherwise "technically feasible," is properly a matter of an affirmative defense to be borne by employers, who are best situated to know their own financial status and the financial impact, both as to "direct" and "indirect" costs, implementation of "technically" feasible controls will have.

---

[9/] The term "feasible" is not defined in the Act or the Air Contaminant Standard.

The definition "announced" (as Respondent puts it), at trial, in the absence of authority to the contrary, is therefore used herein to determine the alleged iron oxide violation.

Industrial Hygienist Martin Dubin, on September 30, 1975, very professionally, carefully and competently obtained air samples from the breathing zone of the arcairing employee, Mr. Wilson.[10/] These samples, properly handled throughout, were ultimately analyzed at the Salt Lake City laboratory of NIOSH. This analysis revealed concentrations of iron oxide, in these samples to be as follows: 23.4 $mg/M^3$; 20.3 $mg/M^3$; 27.2 $mg/M^3$; 19.9 $mg/M^3$. From these results, the eight hour time weighted exposure of Mr. Wilson to the iron oxide fumes, was properly calculated to have been 13.986 $mg/M^3$, thus exceeding the 10 $mg/M^3$ Standard limit. (Tr. Vol. II, pp. 5-94).

The evidence of record clearly establishes Mr. Wilson's exposure to a level of iron oxide fumes in excess of the limit set forth in the Standard. It further establishes, however, without contradiction, that throughout this arcairing operation, Mr. Wilson wore a respirator. It was Respondent's practice, to issue a respirator, either air line or canister type depending on the type of arcairing to be performed, to any employee who is to do arcairing, with the arcairing tool and equipment from the tool room, prior to each arcairing operation. (Tr. Vol. II, pp. 98-109). Instructions on how to use these respirators are given employees and Respondent's safety personnel regularly inspect and enforce the use of this respiratory equipment. (Tr. Vol. II, p. 113; Vol. V, p. 150).

---

[10/] All sampling done by the inspecting Industrial Hygienists were professionally and competently carried out.

Thus, the question presented by this case is whether there existed "feasible" administrative or engineering controls to achieve compliance with the cited Standard, 29 C.F.R. 1910.1000(e). If so, a violation has been established. If not, Respondent was justified in resorting to "protective equipment," i.e., respirators, as spelled out in paragraph (e) of 1910.1000 for the arcairing operation in question; and no violation existed.

The evidence reveals that Respondent's Boiler Shop, within which the arcairing operation in question took place, is approximately 500 feet long and 120 feet wide. This building is divided into two open areas, the low bay and high bay. The low bay is about 45 feet high, the high bay 70 to 75 feet high. In the low bay, two 25-ton overhead cranes operate at about 25 feet from the floor. In the high bay, one 100-ton and three 35-ton overhead cranes also operate. This Boiler Shop, like Respondent's other operations, is essentially a job shop, that is, there exists no production line type of operation. Many varied and individualized parts for ships are fabricated therein, such as bulbous bows, rudders, propellers, boilers, smoke stacks and the like. Many of these ship components are of gigantic size and weight, are fabricated at varying locations within the Boiler Shop on a space available basis. Thus, the physical layout of this shop varies from day to day. (Tr. Vol. V, pp. 177-180, 221-245).

The arcairing type of operation is used extensively throughout Respondent's shipyard and as many as 50 such operations may be in progress on any given day. Within the Boiler Shop, as many as seven or eight arcairing operations are frequently in progress. Large ventilating blowers or fans, capable of moving 186,000 cubic feet of air per minute are located

in the roof of the Boiler Shop. Individual local ventilation equipment is provided to all welders and for employees working in enclosed spaces on ships. Respondent employs ventilation control experts to assure adequate ventilation in enclosed spaces which abound at this shipyard. (Tr. Vol. II, pp. 100, 112; Vol. V, pp. 205-210).

On the day of the inspection, Mr. Wilson was working in the low bay of the Boiler Shop about 50 feet in from the river end of this building. He was engaged in arcairing a large cone and a cylinder. The cylinder was a portion of an inner smoke stack and was about 5 feet in diameter and 30 feet long, and was laying on its side, on a platen (platform), thus resembling a large pipe. Respondent's quality assurance inspectors had marked various welds and other areas on the surface of the cylinder which required arcairing. To accomplish the arcairing, staging had been erected alongside of this cylinder, and Mr. Wilson was observed to arcair from the staging, 5 to 6 feet off the floor, as well as on the bottom portion of the cylinder, about 2 feet from the floor. Upon completion of the arcairing operation, inspectors would reinspect the areas. Other work was performed on this cylinder during the total arcairing process, such as rewelding joints and further inspections. This cylinder was in the Boiler Shop for approximately 45 days and arcairing took place inside as well as outside of the cylinder. (Tr. Vol. V, pp. 177-189, 191, 230). There is no evidence in this record concerning the specifics of the large cone Mr. Wilson was arcairing on the day of the inspection.

As noted earlier, the arcairing process involves melting unwanted metal, such as a defective weld, to a molten state and blowing this molten metal away from the surface by a jet of high velocity air, emitted from

the arcairing tool at from 80 to 100 psi (pounds per square inch). The molten metal, which generates the iron oxide fumes, is thus blown away at about 100 to 125 feet per second (Tr. Vol. III, pp. 90-91). There is thus produced a large, defused shower of sparks and molten metal propelled in a direction away from the operator. If the arcairing operation is a shallow cut, the fume cloud is closer to the operator than if a deep cut is being made. In the latter case, a tunnel like effect is produced and the fume cloud is propelled as far as 25 feet from the operator (Tr. Vol. V, pp. 230, 231). The trajectory of the shower of sparks and molten metal, as well as the iron oxide fume cloud, will also vary depending upon the geometry or shape of the surface being arcaired.

Respondent produced a representative from the Arc Air Company, the manufacturer of the arcair tool used by Mr. Wilson. Although this company, through its Research and Development Department, is currently working in both the noise and fume control area, having spent about $100,000 for various consultants, it as yet has not been successful in devising any system to effectively vent arcairing fumes under the conditions existent at Respondent's work site. Further, he was unaware of any commercially available equipment for dealing with this problem (Tr. Vol. III, pp. 86-142).

Respondent has also performed several experiments attempting to collect and vent away arcairing fumes which were not successful. In 1970, Respondent found that its experimental collector was not successful because the molten metal damaged the impellers in the ventilating blowers and clogged the filters (Tr. Vol. V, pp. 225-227).

Complainant's primary witness concerning the arcairing operation, Mr. Gronka, an Industrial Hygiene Engineer with a private consultant firm,

testified at considerable length to three proposed engineering methods to ventilate the iron oxide fumes away from Mr. Wilson while working on the cylinder. (Mr. Gronka made a post-inspection visit to Respondent's Boiler Shop on May 7, 1976. The cylinder in question was no longer there. He reviewed Industrial Hygienists Dubin's notes to visulize the arcairing operation in question.)

He first suggested the most simple devise, a pedestal fan to blow the iron oxide fume cloud away from Mr. Wilson (Tr. Vol. II, pp. 182-188). He next recommended a "lamb" air mover, which is nothing more than a relatively high velocity, directional fan, to blow the fumes away from Mr. Wilson.

Neither of these suggestions, however, are practical, as pointed out by Respondent's Safety Director, Mr. Walton. Either system merely moves the iron oxide fume cloud from one location to another, which, because of the job shop nature of Respondent's work site, in all probability, would result in blowing the fumes onto nearby workers. Additionally, the high velocity fan (variously denominated a "lamb" air mover, squirrel cage or copas blower), would subject an arcair operator to a significant draft and thus a possible health hazard. Further, any high velocity air mover would also blow dust particles about, with a significant chance of causing such particles to be blown into the eyes of nearby workers, compounding an already common employee complaint of foreign matter in their eyes. Furthermore, because arcairing operations involve the frequent movement of the operator from one location to another upon the huge structures involved, any fan type of ventilation would require the repositioning of any type of fan being used. This would have to be done by ventilation employees, not the arcair operator, or a jurisdictional labor dispute might well ensue (Tr. Vol. V, pp. 211, 216-236).

Mr. Gronka's next suggestion was a system of fume collection and exhaustion away from the operator outside of the building. These systems were to employ various types of collection hoods, connected by duct work to exhaust fans and by additional duct work to outside of the building. Exhibits C-7(a), (b), (c) and C-8 are copies of diagrams depicting these suggested engineering controls. Such exhausting suggestions also involved the use of a platen or platform with motorized rollers, onto which the stack in question would be placed, and rotated so that the arcairing operation could be done at a constant, fixed level off the floor.

These systems all have significant difficulties which make them impracticable. As pointed out by Respondent's Safety Director, if Respondent's work site involved the same operation on a day-to-day basis, perhaps such systems might be made to work effectively. However, Respondent's work is just the contrary, with a constantly changing work environment, with differently shaped, large components of ships being fabricated at ever changing locations within the Boiler Shop. The collection hoods also present a significant problem. The molten metal and sparks created by the arcairing process, being jetted away at high speed from the point of burning, would strike the collection hood and bounce back at the operator, thus subjecting him to the danger of burns. These hoods, to be effective in any way, would have to be positioned at a very precise distance and angle to the point of burning, which would require the constant adjustment of them from one spot to another as the various locations on the stack would be arcaired. Because of the mechanically limited range and configuration which the hooded ducts are capable of, such a system would not be possible of use inside of large ship parts, such as the bulbous

bows or rudders, the interior of which are webbed with reinforcing steel supports. Additionally, the duct work to carry off the fumes would significantly interfere with the movement of the overhead cranes in this Boiler Shop.

The very large, skid mounted exhaust fan also suggested is likewise not practical (See Exhibit C-9). Its implementation would require frequent repositioning within the Boiler Shop, which would require the use of overhead cranes as well as flexible duct work running on the Shop floor to the fan. This ducting on the Shop floor of course would create a tripping hazard.

The use of the platen equippped with motorized rollers, to position the cylinder at issue at a constant fixed level (a necessary part of the fume collection, hood suggestion), is also impractical, because of the necessity for other employees to work upon and within the cylinder during arcairing operations (Tr. Vol. II, pp. 124-214, 215-233; Vol. III, pp. 5-85; Vol. IV, pp. 9-28, 29-103; Vol. V, pp. 133-258).

Although the evidence of record is rather meager as to the toxicity of iron oxide fumes, both parties appear to agree that these fumes present the lowest form of toxicity and constitute no risk of permanent physical injury or disability to employees. It is compared to nuisance dust (Tr. Vol. IV, pp. 17-21; Exh. C-10).

Thus, when dealing with a substance of such admittedly low toxicity, if toxic at all on this record, the Complainant's burden of proving the feasibility, i.e., practicality of suggested engineering or administrative controls, is higher than if a more toxic air contaminant were involved.

Similarly, Respondent's burden of showing infeasibility, i.e., impracticality is proportionatly reduced.

The evidence is also clear and unrebutted that Respondent's employees, including Mr. Wilson, who carry out arcairing operation at this work site, are adequetly protected from iron oxide fumes by well maintained respirators, the use of which is closely monitored and enforced by Respondent's Safety Division.

Upon the evidence of record herein, it is therefore concluded that there existed no feasible engineering or administrative controls available to Respondent for the arcairing operation in question on the day of the inspection. Respondent's utilization of personal protective equipment, i.e., a respirator for the employee engaged in this operation, conformed to the requirements of the Air Contaminant Standard, 29 C.F.R. 1910.1000, and thus, no violation of this Standard has been established.

Based upon the foregoing findings and conclusions, and pursuant to the provisions of Sections 10(c) and 12(j) of the Act, 29 U.S.C. 659(c) and 661(i), it is hereby,

ORDERED:

1. That Item No. 1(a) of the Nonserious Citation herein, alleging a violation of Section 5(a)(2) of the Act, 29 U.S.C. 654(a)(2), for failure to comply with the Noise Standard set forth at 29 C.F.R. 1910.95, is AFFIRMED. No penalty is ASSESSED.
2. Items No. 1(b) and 1(c) of said Citation are VACATED.

3. Item No. 2 of said Citaiton, alleging a violation of Section 5(a)(2) of the Act, 29 U.S.C. 654(a)(2) for failure to comply with the Air Contaminant Standard set forth at 29 C.F.R. 1910.1000 is VACATED.

| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>CYPRUS MINES CORPORATION, d/b/a CYPRUS WIRE AND CABLE COMPANY,<br><br>Respondent. | OSHRC Docket No. 76-616 |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

Cyprus Mines Corporation operates a wire and cable plant in Rome, N.Y. After a compliance safety and health officer inspected Cyprus' plant on October 31, November 3 and November 4, 1975, the Secretary of Labor issued a citation alleging that Cyprus had violated 29 U.S.C. § 654(a)(2), section 5(a)(2) of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"), by failing to comply with the occupational noise standard at 29 C.F.R. § 1910.95(b)(1). 1/

---

1/ This standard provides in part:

> § 1910.95 Occupational noise exposure.
>
> * * *
>
> (b)(1) When employees are subjected to sound exceeding those listed in Table G-16, feasible administrative or engineering controls shall be utilized. If such controls fail to reduce sound levels within the levels of Table G-16, personal

(cont'd)

The citation, as clarified in the complaint, alleged that on November 4, 1975, Cyprus employees in two buildings at the plant had been exposed to sound levels in excess of those permitted by the standard and that feasible administrative or engineering controls had not been used. No penalty was proposed.

Administrative Law Judge Alfieri held a hearing and found that Cyprus was not in violation in the Watson stranding machine area in Building 19 of its plant. He found that Cyprus was in violation in two areas of Building 16 but was not in violation in a third area of that building. The Secretary petitioned for review of that portion of the judge's decision finding no violation in the Watson stranding machine area in Building 19, and Cyprus petitioned for review of that portion of the decision finding a violation in the Vaughn Fine Wire area of Building 16. Commissioner Cleary granted both petitions. 2/

---

(Footnote 1 cont'd)

protective equipment shall be provided and used to reduce sound levels within the levels of the table.

* * *

Table G-16--PERMISSIBLE NOISE EXPOSURES

| Duration per day, hours | Sound level dBA slow response |
|---|---|
| 8 | 90 |
| 6 | 92 |
| 4 | 95 |
| 3 | 97 |
| 2 | 100 |
| 1 1/2 | 102 |
| 1 | 105 |
| 1/2 | 110 |
| 1/4 or less | 115 |

(Footnote omitted).

2/ Former Commissioner Moran also directed review "for error." Neither party has challenged the judge's disposition of the citation with respect to the Bartell-Watson area or the Cook-Butt area of Building 16. Mr. Moran's general direction for review did not specify any issues, and the parties have not raised issues other than those specified by Commissioner Cleary. Inasmuch as we find no compelling public interest that would warrant review

(cont'd)

## I. BUILDING 19 - WATSON STRANDERS

### A

Two stranding machines manufactured by the Watson Machine Company were in Building 19. One was a seven-strand machine; the other was a twelve-strand machine. The machines were separated by an aisle about fifteen feet wide. On November 3, 1975, there was one employee working in the area, the machine operator. The compliance officer took noise level readings with two different instruments. He used a sound level meter to take readings in different locations around the work area once during each hour of the eight-hour workshift. The readings ranged from 101 to 103 dBA. The compliance officer also fastened a noise dosimeter near the ear of the machine operator to determine the amount of noise to which the operator was exposed during his entire shift. The dosimeter readings showed that the operator, who was not using any protective equipment, was exposed to noise levels equal to 459% of the permissible levels. 3/

After Cyprus contested the citation, the compliance officer returned to the plant with Norman L. Meyerson, an acoustical engineering expert, to determine what feasible engineering or administrative controls could be implemented to reduce the noise in the cited areas. In the time between the inspection by the compliance officer and the visit by Mr. Meyerson, Cyprus had had the seven-strand

---

(Footnote 2 cont'd)

of issues not raised by the parties, such issues will not be considered on review. See Water Works Installation Corp., 76 OSAHRC 61/B8, 4 BNA OSHC 1339, 1976-77 CCH OSHD ¶ 20,780 (No. 4136, 1976); Abbott-Sommer, Inc., 76 OSAHRC 21/A2, 3 BNA OSHC 2032, 1975-76 CCH OSHD ¶ 20,428 (No. 9507, 1976). The unreviewed portions of the decision are accorded the significance of an unreviewed judge's decision. See Leone Constr. Co., 76 OSAHRC 12/E6, 3 BNA OSHC 1979, 1975-76 CCH OSHD ¶ 20,387 (No. 4090, 1976), appeal withdrawn, No. 76-4070 (2d Cir. May 17, 1976).

3/ Cyprus has not argued that employees were not shown to have been exposed to excessive noise.

machine fixed because it was badly in need of repair and was ready to break down. 4/ The repairs cost approximately $32,000 and would have been necessary whether there had been a citation or not. As a result of the repairs, the noise produced by the seven-strand machine was reduced so that sound level readings taken with the twelve-strand machine off ranged from 80 to 87 dBA. With both machines running, the noise levels ranged from 85.5 dBA to 94 dBA.

The Secretary's expert testified that similar repairs to the twelve-strand machine would bring noise in the area down to Table G-16 levels. Cyprus presented testimony that the cost of repairing the twelve-strand machine would be at least $50,000 to $60,000. If the gearbox needed repair, the added cost would be $10,000 to $20,000; the total cost of the repairs might therefore range from $50,000 to $80,000. Cyprus argued to the judge that the reduction in noise levels resulting from the repairs meant that the violation had been cured and no violation should be found in Building 19.

B

In his decision, Judge Alfieri found that the operator was exposed to noise levels of 101-103 dBA at the time of the original inspection but that, at the second inspection, the noise made by the repaired seven-strand machine was below the level permitted by the standard for an eight-hour exposure. Judge Alfieri found that because the repairs to the seven-strand machine lowered the noise

---

4/ Mr. Meyerson's written report recited that a Cyprus safety administrator had stated that the repairs had been made to reduce noise levels. At the hearing, however, the vice president and general manager of Cyprus Wire testified that the repairs were made because the machine was ready to break down. We find the testimony of the Cyprus official more reliable than the hearsay in Mr. Meyerson's report. We therefore find that the machine repairs were necessary regardless of the noise it produced.

emanating from it alone to below 90 dBA over 8 hours, "[i]t follows therefrom that there are feasible engineering controls available for the Watson strander machines in building #19." In considering the costs of the repairs, the judge merely noted the estimated cost of repairing the twelve-strand machine and that Cyprus does $450,000,000 volume of business annually. He concluded that the cost "does not render the proven controls economically infeasible."

The judge then focussed on the question of whether the violative condition continued to exist after the repairs. Relying on the readings taken during the second visit and on evidence that one machine was often shut down while the operator performed his duties and that the operator is away from the machines for part of his shift, the judge concluded that the Secretary had not proved that the machine operator was then being exposed to an excessive level of noise in this area. He therefore vacated the citation insofar as it pertained to this area.

C

In his petition for review, the Secretary argued that the evidence clearly established the existence of a violation on the day of the compliance officer's first inspection of Building 19 and that it was error for the judge to vacate the citation on the ground that a violation did not continue to exist. The Secretary contends that the evidence as to the reduction in noise resulting from the repairs is proof only that feasible engineering controls exist to reduce noise in the cited area. He argues that it is inconsistent with the purposes of the Act to permit corrective measures taken after the inspection to negate the existence of the violation alleged in the citation. The Secretary urges that the evidence clearly establishes that the employee was exposed to excessive levels of noise on the date of the initial inspection and that the Secretary is not required to show that this overexposure continued to exist.

Cyprus, on the other hand, argues that the judge's finding was correct and should be affirmed. Cyprus argues that evidence as to the feasibility of an engineering control must relate to the character and intensity of the noise found by the expert during his later visit to the plant.

D

We agree with the Secretary that the judge erred in vacating the citation on the ground that the violation did not continue. The question is whether the cited condition existed on the date the violation is alleged to have occurred. Abatement of a violative condition after a citation has been issued does not negate or excuse an employer's prior failure to comply with the requirements of the Act. Gannett Rochester Newspaper Corp., 81 OSAHRC 35/A2, 9 BNA OSHC 1590, 1981 CCH OSHD ¶ 25,323 (No. 6352, 1981), and cases cited. Although the Secretary himself introduced the evidence of later reductions in noise levels, that evidence was introduced for the purpose of establishing the existence of feasible engineering controls. There is no basis for concluding that the parties impliedly consented under Fed. R. Civ. P. 15(b) to try whether a violation existed only on the date of the second visit.

Inasmuch as it is uncontested that the operator was exposed to excessive noise levels on the date that the violation is alleged to have occurred, the remaining question is whether the proposed engineering controls, repairs to the machines, were feasible within the meaning of section 1910.95(b)(1). We find that the repairs to the seven-strand machine are feasible engineering controls, both technologically and economically.

The Commission has recently considered the meaning of the term "feasible" in light of American Textile Manufacturers Institute, Inc. v. Donovan, 452 U.S. 490 (1981), in which the Supreme Court held that "feasible" means "achievable" or "capable of being done." In Sun Ship, Inc., OSHRC No. 16118, issued this day, the Commission held that where technologically feasible controls will significantly

reduce noise levels, the Secretary may show economic feasibility by showing either that the cost of engineering and administrative controls will not threaten the cited employer's long-term profitability and competitiveness, or that the employer's inability to afford the cost of controls results from the employer's lagging behind its industry in providing safety and health protection for employees. Sun Ship overruled Continental Can Co., 76 OSAHRC 109/A2, 4 BNA OSHC 1541, 1976-77 CCH OSHD ¶ 21,009 (No. 3973, 1976), appeal withdrawn, No. 76-3229 (9th Cir. April 26, 1977) ("Continental Can"), to the extent that Continental Can had required that costs of controls be weighed against their benefits.

The analysis of the feasibility of engineering controls applied by the judge in this case is inconsistent with the current Commission precedent. We have therefore reviewed the evidence and find [5/] that, as to the seven-strand machine that was repaired, the engineering controls suggested by the Secretary, repairs to the machine, were feasible steps. The repairs were obviously achievable. The reduction of noise levels--by at least 7 dBA--was significant. Inasmuch as the repairs to the seven-strand machine did not add any cost that Cyprus otherwise would not have incurred, the added costs for noise abatement were zero. Accordingly, we find that with respect to the seven-strand machine, there were feasible engineering controls that could have been used and there was a violation in the Watson Strander area of Building 19 at the time alleged in the citation and complaint.

It is unnecessary here to determine whether repairs to the twelve-strand machine are required. The repairs to the seven-strander reduced noise levels in

---

5/ The Commission has the authority to make findings of fact itself, independent of the administrative law judge. Butler Lime & Cement Co., 79 OSAHRC 103/D12, 7 BNA OSHC 1973, 1979 CCH OSHD ¶ 24,091 (No. 855, 1979), rev'd on another ground, 658 F.2d 544 (7th Cir. 1981).

the area to 85.5 to 94 dBA when both machines were operating. Inasmuch as the employee working in the area moved around during the day, it is uncertain whether any further measures would be necessary to reduce his noise exposure. We also note that the citation and complaint alleged that there was excessive noise in the Watson Strander area and that Cyprus had not instituted feasible engineering or administrative controls in that area. The citation and complaint did not purport to require abatement of any particular sort or require that abatement measures be instituted on both machines. Although at the hearing the Secretary focussed on repairing the seven- and twelve-stranders because he was required to establish that there were feasible engineering controls available, Cyprus is not required to adopt the abatement method suggested by the Secretary, even one found feasible by the Commission; it may satisfy its duty to comply with the standard by using any feasible method that is appropriate to abate the violation. Cf. General Electric Co., OSHRC No. 79-504, slip op. at 16, n.6 (Sept. 30, 1982) (section 5(a)(1) case requires use of any feasible means or a combination of feasible means); Kelly Springfield Tire Co., 82 OSAHRC _____ , 10 BNA OSHC 1970, 1975 n.5, 1982 CCH OSHD ¶ 26,223, p. 33,114 n.5 (No. 78-4555, 1982)(same); Ted Wilkerson, Inc., 81 OSAHRC 70/D8, 9 BNA OSHC 2012, 1981 CCH OSHD ¶ 25,551 (No. 13390, 1981) (section 5(a)(1) case requires proof of feasible abatement; employer allowed to show it used other abatement method); Brown & Root, Inc., 80 OSAHRC 97/A2, 8 BNA OSHC 2140, 1980 CCH OSHD ¶ 24,853 (No. 76-1296, 1980)(same). For these reasons, it is unnecessary in this particular case to go beyond our finding that the repairs to the seven-strander were feasible and significantly reduced the noise.

## II. BUILDING 16--VAUGHN FINE WIRE AREA

### A

Cyprus does not deny that there was excessive noise in the Vaughn Fine Wire area but contends that the Secretary has not proved that the engineering con-

trols proposed are feasible. The Vaughn Fine Wire area occupies about 3,000 square feet on the second floor of Building 16 and contains twenty Vaughn machines in four rows containing five machines each. There are two aisles with five machines on each side of the aisle, so that ten machines face each aisle. The machines in the two inner rows are back to back very close to each other, and the aisles from which employees work are between the outer rows and the inner rows. Two machine operators work in this area, one operator for each aisle. In addition, there are oilers and maintenance workers who also work in this area.

The machines pull wire from large supply spools through dies and feed the wire onto smaller reels or spools. Sometimes all ten machines on an aisle will be in operation at one time, but often only seven or eight will be operating. The operators must replace the empty large supply reels and remove and replace the full take-up reels. The supply reels weigh approximately 500 pounds and the finished reels are 30 to 40 pounds. The operators must check the take-up reels to see that they are winding properly and must make adjustments to the dies and the machines. Cyprus' vice president of manufacturing estimated that one operator would need to have access to the machines about 500 times in an eight-hour shift.

The compliance officer testified that during the inspection he recorded readings of 96 and 97 dBA once each hour throughout the 8-hour shift and that the dosimeter readings indicated that the employees were exposed to 283% of the permissible noise levels. The Secretary's expert witness, Mr. Meyerson, stated that he measured noise levels of 98 dBA while he was standing in the aisle among four of the machines. Only three of the machines were operating at the time he took that measurement.

Mr. Meyerson stated that one way to decrease the noise levels would be to spread out the machines so that the noise was not concentrated in a small area. Because of space limitations, however, he said this solution was not possible.

He therefore suggested that the machines be enclosed with sound-absorptive materials. In each row, the machines are separated into a group of two and a group of three. Because the middle rows are so close, they constitute one group of four machines and another group of six. Mr. Meyerson recommended that each group in the outer aisles be enclosed and that each group in the middle be enclosed, with a double sided sound-absorptive wall between the backs of the machines in the two middle rows. In order to permit access to the machines, he recommended that at the front of each machine the enclosures have doors that would slide either horizontally or vertically. He recommended windows in the doors to allow visual checking of the machines. Because the machines produce heat, Mr. Meyerson suggested that there not be tops on the enclosures. He testified that the enclosures could be made of readily-available panels at nominal cost, and that they would reduce the noise by at least 15 decibels. He testified that enclosures of this type are used in textile plants.

Mr. Barrett, Cyprus' vice president of manufacturing, testified on behalf of Cyprus. Mr. Barrett holds a bachelor's degree in chemical engineering and a bachelor's degree in business administration. He testified that the machines in the center groups were too close together to permit the wall in the middle of the proposed enclosures, and he expressed the opinion that the wall would make necessary maintenance impossible. Mr. Barrett stated that he believed the proposed enclosures were not feasible because they would limit access to the machines and slow down or inconvenience the operators and employees performing maintenance on the machines. He testified that the enclosures would require the machines to be shut down for some operations, thereby reducing productivity. Mr. Meyerson testified in rebuttal that the wall need not be permanent or solid but could be made of removable modular panels with some space beneath and between them, so they need not interfere with maintenance or repairs.

Mr. Barrett stated that he believed that the enclosures would not really reduce employee exposure to noise because the employees would constantly have to

open the doors to work on the machines and would then be exposed to the full force of the noise. On rebuttal, Mr. Meyerson testified that the absorptive enclosures would reduce the amount of noise the employee would be exposed to even if the employee had to open the door to perform his duties and that the noise from machines in other enclosures would be reduced. His written report stated that, even with the door open, employees "will be exposed to only a fraction of the noise now impacting [them]."

The Secretary's evidence was that the cost of the enclosures would be "nominal" and that the enclosures could be installed on weekends or other times when the machines would be off. The Secretary offered no estimated cost of enclosing the Vaughn machines, and Cyprus presented no monetary figures for the costs of constructing the enclosures or estimates as to how much its production might be reduced if the enclosures were installed. Cyprus also presented testimony that doors opening into the aisle might pose new dangers and obstruct both access to adjacent machines and the aisles.

B

In his decision, Judge Alfieri noted that although Cyprus did not deny that its employees were exposed to noise levels above those specified in Table G-16, Cyprus asserted that the Secretary had not proved the feasibility of the controls because he had not shown that the controls would bring the noise within permissible limits. The judge rejected Cyprus' argument, stating that the engineering controls need not reduce the noise to the levels permitted by the standard in order to be considered feasible. He found that the enclosures were a feasible engineering control because they could be fabricated "from readily available materials at economical cost," and would reduce the noise by 10 to 15 dBA. He stated that "it is not shown that the anticipated construction problems are insurmountable." The judge mentioned an engineering report prepared for Cyprus

that was introduced into evidence by the Secretary over Cyprus' objection. That report concluded that partial enclosure would bring the operator' exposure to noise within permissible levels. Addressing the adverse effect of the enclosures on Cyprus' production, the judge found that there was not sufficient evidence to find that the engineering controls were "infeasible." He found that Cyprus' argument that the enclosures might themselves cause a hazard was not substantiated. The judge found a violation in this location but assessed no penalty. He found also that, because experimentation with the proposed controls was necessary, an abatement period of 2 years, six months was reasonable, instead of the one year period provided in the citation.

C

Cyprus petitioned for review of this portion of the judge's decision, maintaining that the evidence establishes that the engineering controls are not feasible. Cyprus argued that its evidence that the enclosures would create operational and maintenance problems outweighed the Secretary's evidence. On review, Cyprus argues that the Secretary's proposal for enclosures represents "the completely theoretical nature of his approach." Cyprus argues that, because the operators would have to open the doors to work on the machines approximately 500 times a shift, they would be exposed to excessive noise levels anyway. Therefore, reasons Cyprus, when the duties of the employee are taken into consideration, the Secretary has not proved that the enclosures would make a significant reduction in the level of the employee's exposure. Cyprus also contends that the enclosures are not feasible because they would cause a reduction in productivity and would interfere with maintenance on the machines.

D

We do not agree with Cyprus' argument that, because doors would often be open, the Secretary failed to show that the enclosures were feasible. Cyprus

argues that the operators would therefore be exposed to excessive noise even with the enclosures. The enclosures would be made of noise absorbent materials, and the Secretary's expert testified that the noise levels would be reduced even with the door open. As the Secretary also points out, the other enclosures would absorb the noise from the other machines even while the door to one booth was open. Even if the noise level would be above the level permitted, the enclosures need not reduce noise to permissible levels in order to be feasible; they need only make a significant reduction in the existing noise levels. Sun Ship, slip op. at 11 n.10, and cases cited.

We agree with the judge's finding that the noise-absorbent enclosures were a technologically feasible engineering control. Cyprus argues, and Mr. Barrett testified, that the motors of the machines in the center rows are too close together for the center wall to fit. Mr. Meyerson testified, however, that, because the purpose of the enclosures is to absorb the noise rather than to wholly contain it, the walls need not be solid, and that there could therefore be openings in the wall to accommodate the motors. We also reject Cyprus' argument that the enclosures would make it impossible to do repairs or servicing on the Vaughn machines; Cyprus points, for example, to Mr. Meyerson's testimony that, with one door open, access to the adjacent machine might be obstructed. Mr. Meyerson testified, however, that because the enclosures could be constructed of removable panels, one could gain access to perform maintenance. Finally, Cyprus argues that a door could be accidentally closed on an employee, causing him to be injured. Judge Alfieri correctly found that the evidence on this issue was highly speculative and gave it little weight. 6/

---

6/ We acknowledge that the use of enclosures with doors would not be entirely free of difficulty. For example, overhead garage-type doors could not be used in part of the area because several machines have overhead mezzanine

(cont'd)

Cyprus argues that the enclosures were not proved to be feasible because they would slow maintenance work on the machines, cause loss of time, and reduce production. These factors may be considered in determining whether the proposed noise controls are economically feasible. See Sun Ship, slip op. at 19.

When this case was tried, the Commission had not yet held, first in Continental Can and recently in Sun Ship, that the cost of engineering controls is relevant to their feasibility. The parties here did not litigate the economic aspects of feasibility under the approach of Sun Ship. The evidence on the point is sparse. The Secretary's expert testified that the noise-absorbent panels were commercially available at "nominal" cost, but he gave no estimate of the cost of the materials or of the cost of erecting the six enclosures required. Although Cyprus presented testimony that the enclosures would present a "nightmare" for the operators and for employees performing maintenance on the machines, this testimony does not enable us to determine how much time would be lost or how much production would be reduced. There is no evidence in the record as to Cyprus' ability to absorb the direct or indirect costs of the engineering controls. We therefore remand this case for the parties to present further evidence as to the anticipated costs, both direct and indirect, of the proposed noise abatement controls and for the application of our decision in Sun Ship.

III.

One last issue remains. At the hearing, the Secretary introduced into evidence portions of a report of a noise study of Cyprus' plant done in 1974 by

---

(Footnote 6 cont'd)

grills that would obstruct the doors. The sliding doors would obstruct aisle traffic when they were open. Despite these difficulties, we are convinced that, on the whole, the booths are feasible.

an engineering firm hired by Cyprus. The report recommended that the operator desk in the Vaughn Fine Wire area be enclosed or that the machines be partially enclosed. Cyprus objected to the admission of the report on the ground that the study was not performed by Cyprus and there was no evidence that the report had ever been adopted or acted on by Cyprus. The judge admitted it into evidence and considered it in determining the technological feasibility of controls. On review Cyprus has renewed its objection to the report, relying on a ruling of an administrative law judge in an earlier case in which Cyprus was a party involving a different area of the same plant. In the earlier case, the judge sustained Cyprus' objection to the report.

Cyprus' argument that the report was not written or adopted by Cyprus raises a hearsay objection. See Fed. R. Evid. 801(d)(2)(A) and (B)(statements of or adopted by a party). Hearsay is admissible in administrative proceedings. Hurlock Roofing Co., 79 OSAHRC 93/A2, 7 BNA OSHC 1867, 1979 CCH OSHD ¶ 24,006 (No. 14907, 1979). We therefore conclude that Judge Alfieri properly admitted the engineering report.

Accordingly, that portion of the judge's decision dealing with the Watson Stranders in Building 19 is reversed, and the portion of the citation alleging a violation in that area is affirmed. We assess no penalty. With respect to the Vaughn Fine Wire Area in Building 16, this case is remanded for further proceedings consistent with this decision.

SO ORDERED.

Syracuse, New York 13202
Attorney for respondent
by William L. Broad, Esq.

## DECISION AND ORDER

Alfieri, Judge.

## STATEMENT OF THE CASE

This is a proceeding under section 10 of the Occupational Safety and Health Act of 1970 (29 U.S.C. 651 et seq.)

contesting an other than serious citation issued on January 9, 1976 by the complainant against the respondent under the authority vested in the complainant by section 9(a) of the Act (29 U.S.C. 658(a)).

The citation alleges that a November 4, 1975 inspection made of respondent's workplace, a wire and cable plant, described as a complex of one and two-story buildings, located at Rome, New York, showed the respondent violated section 5(a)(2) of the Act (29 U.S.C. 654(a)) because it failed to comply with occupational safety and health standard 29 CFR 1910.95(b)(1), relating to occupational noise exposure, promulgated by the Secretary under section 6 of the Act (29 U.S.C. 655). The citation requires a one year multi-step abatement. No penalty is proposed.

In accordance with section 10(c) of the Act (29 U.S.C. 659(a)) respondent by a letter dated January 30, 1976, timely contested the citation and the time and method of the abatement.

The standard 29 CFR 1910.95(b)(1) provides:

> (1) When employees are subjected to sound exceeding those listed in Table G-16, feasible administrative or engineering controls shall be utilized. If such controls fail to reduce sound levels within the levels of Table G-16, personal protective equipment shall be provided and used to reduce sound levels within the levels of the table.

TABLE G-16-PERMISSIBLE NOISE EXPOSURES[1]

| Duration per day, hours | Sound level dBA slow response |
|---|---|
| 8 | 90 |
| 6 | 92 |
| 4 | 95 |
| 3 | 97 |
| 2 | 100 |
| 1-1/2 | 102 |
| 1 | 105 |
| 1/2 | 110 |
| 1/4 or less | 115 |

[1] When the daily noise exposure is composed of two or more periods of noise exposure of different levels, their combined effect should be considered, rather than the individual effect of each. If the sum of the following fractions: C1/T1+C2/T2...Cn/Tn exceeds unity, then, the mixed exposure should be considered to exceed the limit value. Cn indicates the total time of exposure at a specified noise level, and Tn indicates the total time of exposure permitted at that level.

Exposure to impulsive or impact noise should not exceed 140dB peak sound pressure level.

The description of the alleged violation reads:

> The Stranders and Wire Machines in the Bare Wire Area, Building #16, 2nd floor and the Stranders in Building #19, generate sound levels that exceed unity when calculated on an 8 hour time weighted average and exposes the employees in these areas to excessive sound levels.

## MULTI-STEP ABATEMENT

I. Immediate Temporary Controls:

(a). Provide employees working on the Stranders and Wire Machines in the Bare Wire Area (Building 16, 1st and 2nd floor) and the Stranders in (Building #19) with (1) hearing protection or (2) reduce employee exposure to excessive noise levels by administrative controls (for example, temporary assignment of employee to a low noise area).

II. Permanent Engineering Controls:

(1) By April 8, 1975 submit to OSHA* a reasonable sequence of dates showing the following minimal information:

(a) An engineering study to determine whether it is feasible to reduce the noise within the above mentioned areas by an engineering method,

(b) A date when OSHA* will be notified of the employer's decision whether the noise will be reduced by an engineering method,

(c) A sequence of dates showing a schedule for the implementation of engineering controls if deemed feasible,

(d) A final date showing a date for completion,

(e) Continue immediate temporary controls until completion of permanent engineering controls,

(f) You may provide OSHA* with a monthly progress report until the completion of permanent engineering controls.

(2) By January 9, 1977 complete the engineering controls needed to reduce noise levels to acceptable levels.

*MR. CHESTER C. WHITESIDE
AREA DIRECTOR
U. S. DEPARTMENT OF LABOR
OCCUPATIONAL SAFETY & HEALTH ADM.
700 E. WATER STREET
203 MIDTOWN PLAZA
SYRACUSE, NEW YORK 13210

Respondent moved to have stricken from the record any reference to the first floor of Building #16 on the ground that it was not part of the citation and complaint. Complainant acknowledged that the area was included in his investigator's reports but not included in the citation and complaint. The motion was granted.

The four areas of the plant that are the subject of this proceeding and respondent's position concerning each of these areas[1/] are as follows:

Building 19. If the complainant has proved a violation, respondent has either cured it or the complainant is estopped to deny that respondent has cured it.

Building 16.

Bartell-Watson Area. Respondent does not deny that there is a noise violation nor that there are effective engineering controls. The basic question here is a reasonable time for abatement.

Cook and Butt Area. Respondent submits that the complainant has not proved a noise violation in this area.

Vaughn Fine Wire Area. Respondent does not contest the existence of a violation, but asserts that the complainant has not proved there are feasible administrative or engineering controls to bring noise levels within the permissible limits of Table G-16.

---

1/ Respondent's post-hearing brief, p. 2.

## I S S U E S

1. Whether or not in Building #19 the respondent violated the standard 29 CFR 1910.95(b)(1).

2. Whether or not the time within which the violation in the Bartell-Watson area is reasonable.

3. Whether or not in the Cook and Butt area the respondent violated 29 CFR 1910.95(b)(1).

4. Whether or not complainant has established that there are are feasible administrative or engineering controls to reduce the sound levels in the Vaughn Fine Wire area.

## SUMMARY OF EVIDENCE

The complainant produced two witnesses, Ruben Isaacson, an industrial hygienist and Norman Meyerson, an expert in acoustic engineering controls.[2/]

Mr. Isaacson testified that he held an opening conference with officers of the respondent on October 31, 1975. Following that he proceeded to conduct the walk-around inspection of Buildings numbered 19 and 16, accompanied by Mr. Jaynes, respondent's safety director and a union representative. On November 3, 1975, he returned to respondent's

---

2/ Respondent stipulated that Mr. Meyerson is an acoustical expert. His resume appears as Exh. C-7.

complex bringing with him sound level testing equipment that he had calibrated the night before (Tr. 15). The equipment has a margin of error of 2% plus or minus (Tr. 52).

Building #19

Isaacson, accompanied by respondent's safety director Jaynes (Exh. C-3(a)), commenced the survey in building #19 which he described as a one-story masonry structure with a wood ceiling. It has a twelve-foot high wall on one side and a four-foot high wall on the other side leading to another building (Tr. 16). For the survey, Isaacson selected the operator of the Watson stranding machines numbered 217-06 and 216-05. These machines, shown on Exhibit C-1 and depicted in photographs marked Exhibits C-4(a) through (h) are separated by a fifteen-foot wide aisle (Tr. 21). During the course of the day, the machine operator's duties are to change spools and check the machines which are on both sides of the operator's log desk. A star and circle on Exhibit C-1 indicates the desk location (Tr. 26).

A Dupont Noise Dosimeter placed on Mr. Szmurlo, the machine operator, and a hand held General Radio Sound Level Meter were used to take readings every hour (Tr. 18) for a full eight hour shift (Tr. 26).

The completed survey showed that in Szmurlo's work area, the hand held sound level meter readings ranged from 101 dba to 103 dba. The dosimeter readout exposure was 459% (Exh. C-2(a)). Isaacson explained that readout exposure is the percent of allowable exposure[3/] as read on the readout unit for the dosimeter (Tr. 25). Szmurlo, was the only employee in the area and he was not wearing ear protection. He was observed working from one to six feet from the noise source (Exh. C-2(b)). However on cross-examination, Isaacson said the distance could be seven and one-half feet (Tr. 22).

Complainant's second witness was Norman L. Meyerson[4/] an acoustical expert with Ostergaard Associates, the company retained to do an evaluation of feasible engineering and administrative controls of respondent's plant.[5/]

For the express purpose of carrying out the above objectives, the Cyprus Wire and Cable Company was visited by Meyerson on May 24, 1976, in the company of Rubin Isaacson.

---

3/ The noise levels shown in Table G-16 which appears at page 3.

4/ Resume appears as Exhibit C-7.

5/ Mr. Meyerson's report dated June 15, 1976, appears as Exhibit C-8(a). Addenda to the report appears as Exhibits C-8(a)(b)(c) and (d).

At Cyprus, Mr. Carter H. Strickland of the law firm representing Cyprus Wire; and Mr. Richard F. Compo, Cyprus safety administrator, accompanied Messrs. Meyerson and Isaacson during the visitation to buildings numbered 19 and 16.

Meyerson learned from the respondent's representatives that subsequent to Isaacson's inspection repairs were made on the Watson strander machine, number 216-05[6/] specifically to reduce the noise level emiting from it (Exh. C-8(a) p. 3). This was borne out by the readings taken by Meyerson between machines 217-06 and 216-05 (Exh. C-8(a) p. 4). With 217-06 shut down the noise level from 216-05 ranged from 80 dba to 87 dba (Exh. C-8(b)). With both machines operating, the noise level tested in the middle of the floor (Tr. 60) ranged from 85.5 dba to 94 dba (Exh. C-8(b)). Meyerson did not take any noise level readings at the log station where the machine operator normally is when both of the machines are operating (Tr. 68, 98; Exh. C-8(a) p. 13).

Directing his testimony to his findings of feasible engineering and administrator controls for this building (Exh. C-8(a) pp. 12, 13), Meyerson expressed the view that if machine number 217-06 were to undergo repairs like those

---

6/ Throughout the Meyerson report, Exh. C-8(a) and testimony, the machine is erroneously identified as 215-06.

done to 216-05 "[T]he exposure in the area will become very close to the statutes (sic) if not below" (Tr. 66). In his report, Meyerson makes the observation that "the gear box at the puller capstan location" is excessively noisy and recommends replacement (Exh. C-8(a) p. 13). If that proved unsuccessful then, according to Meyerson, an enclosure like the one shown as figure 7 at page 16 of his report (Exh. C-8(a)) could be used (Tr. 77). An alternative measure would be to use personnel enclosures. These are shown on p. 17 of Exh. C-8(a).

Administratively, respondent could have the operator's log desk moved to an area between the machines "... which brings him into an area even now, that is in the order of 86 decibels. Away from being between the two machines where gear boxes and the pulleys and cones are located" (Tr. 68). Such a move would reduce the employee noise exposure to an acceptable level (Exh. C-8(a) p. 13).

Photographs of the machines (Exhs. 9(a) through (d)) were placed into evidence through this witness.

Cross-examination elicited from Meyerson that at the start of the survey he had trouble with the mast extension of the General Radio sound level meter. After curing the problem he did not recalibrate the meter (Tr. 95-96). He further acknowledged that at page 13 of his report (Exh. C-8(a)), the reading 86 dba was in error (Tr. 98). On redirect examination, he said it should have read 94 dba (Tr. 110).

Charles R. Kunkle, Sr.,[7/] respondent's vice-president and general manager, testified that the repairs for machine 216-05 cost $32,000 (Tr. 128). He estimated it would cost from $50,000 to $60,000 to repair machine number 217-06 and an additional $10,000 to $20,000 if the gear box needed to be replaced (Tr. 128-129).

According to Kunkle, the machine's operator spends one and one-half hours per shift setting up the machine (Tr. 127) during which time the machine is not operating (Tr. 128) and the same time walking between the machines and the remainder at the log desk (Tr. 128).

Building #16 - Second floor

Bartell-Watson Area

On November 4, 1975, Isaacson, using sound test equipment calibrated the night before (Tr. 26, 27), inspected the second floor of building #16. Commencing at 7:30 A.M. and ending 3 P.M. sound level readings were taken in the areas where the respondent's employees Smith, Kelly and Demuth were working. These areas appear on Exh. C-3(g) marked as 3[8/], 4 and 5 respectively (Tr. 30, 31) and pictured in Exhibits C-5(a) through (j). None of the employees were wearing ear protection equipment (Exhs. C-3(b)(c) and (d).

---

7/ Mr. Kunkle holds a B.S. degree in engineering and a M.A. degree in business administration.

8/ The witness corrected the location of Mr. Smith to show as 3 in ink. The location marked 3 in red was in error (Tr. 31).

The completed survey (Exh. C-3(a)) shows that in Smith's area the sound meter readings ranged from 96 to 97 decibels. At Kelly's work station, the sound meter showed a decibel span of 93 to 94. The readings at Demuth's location showed a range of 96 to 98 decibels. The dosimeter readouts for Smith, Kelly and Demuth showed 283%, 185% and 314% respectively (Exh. C-3(a)).

Meyerson testified (Tr. 70) that the readings taken by him on May 24, 1975 at the locations marked M, N, O and P on the floor plan (Exh. 8(a) p. 8 fig. 4), showed sound levels in excess of 95 dba; at point "Q" on the plan, the reading was 93 dba. The machines are shown in Exh. 10(a) through (e) (Tr. 71, 72).

Directing his testimony specifically to twenty-four[8a/] machines in the area, Meyerson said that not all needed to be enclosed to bring the noise level within acceptable range (Tr. 74), (Exh. C-8(a) p. 15) and that feasible engineering controls in the form of enclosures were available from the Bartell machine manufacturer (Tr. 75). (Exh. C-8(a) p. 14). He also stated that a reasonably simple construction of existing materials can be fashioned to form an enclosure for the Watson machine. It is shown as figure 7 of his report (Exh. C-8(a)) (Tr. 77). An alternative control measure would be enclosures for the machine operators (Tr. 78) (Exh. C-8(a) fig. 7 p. 16).

---

8a/ 21 Bartell and 3 Watson machines.

Respondent's vice-president, Charles R. Kunkle, Sr., acknowledged that in the Bartell-Watson area there is a noise problem (Tr. 131) for which there are feasible engineering controls (Tr. 135). However, an independent noise testing done by respondent with six machines operating and eighteen shut down, showed an excess of 90 dba. From this, Kunkle concluded that eighteen of the machines, if not the entire twenty-four, would have to be enclosed to bring the noise level to 90 dba (Tr. 131).

In his opinion, it would take about six months of experimenting to make a suitable enclosure (Tr. 132, 139).

In his further opinion, after making certain that there will be a minimum inconvenience to plant operation (Tr. 141), and taking into consideration customer service demands, interdependency of departments, economics and that there are three or four different types of machines involved, it would take a minimum of three years to abate the violation (Tr. 133, 134). His estimate of the cost of each enclosure is $4,000 (Tr. 132, 147) or $100,000 for the twenty-four machines (Tr. 132).

When cross-examined, Kunkle disclosed that there are twenty-one Bartell machines and three Watson machines in the area. They are operated on three shifts five or six days per week (Tr. 137). At one time, eighteen to twenty

of the machines are operating but not necessarily the same machines every day (Tr. 138).

The Cook and Butt Area

Relative to this area, Meyerson testified that the sound level readings were marginal. One machine that was vibrating had a sound level of 91-1/2 dba and the sound levels at the other machines never exceeded 92 dba (Tr. 78). These levels are not considered a definite employee hazard and could be further reduced if the Bartell-Watson machines in the area were engineered to reduce their noise levels (Exh. C-8(a) p. 19). Meyerson, referring to his report, stated:

> "I have, in the report, indicated that I felt that this area of the Cook and Butt machines, that requires nothing to bring it in to compliance. Since I could not verify the fact that we were materially over 90 dba.
>
> We have to remember, when dealing with various frequencies, we're dealing with a tolerance, with a sound level meter, of plus or minus 1 db."

Complainant's exhibits C-6(g) and (h), photographs of Cook and Butt machines, were previously introduced into evidence through Isaacson who keyed the photographs to the plant floor blueprint, exhibit C-3(g) (Tr. 46).

The Vaughn Fine Wire Area

Meyerson described the area as a very compact, highly congested machine complex (Tr. 84), of twenty Vaughn machines in an estimated area of about 3,000 square feet[9/] (Tr. 83). Exhibits C-12(a) through (i) are photographs introduced to show the alleged congestion (Tr. 84).

When the Vaughn machines numbered 11, 16 and 17 (shown on diagram at p. 22 of Exh. C-8(a)) were sound tested, the readings were 98 dba (Tr. 84).

Focusing his testimony on the methods of abatement, Meyerson said one approach is by means of absorptive enclosures to set off groups of Vaughn machines as illustrated at p. 22 of Exh. C-8(a) into separate rooms (Tr. 89) and a single enclosure for the Bartells (Tr. 92). The rooms can be constructed of commercially available modular panels that are nominal in cost (Tr. 90). The panels are bi-fold or sliding units which would permit the operator to have access to the machines (Tr. 89, 91).[10/] They are guaranteed to reduce the noise level by 15 decibels (Tr. 91) and are a conventional method for all forms of textile and wire machinery (Tr. 90).

---

9/ At p. 20 of his report (Exh. C-8(a) Meyerson shows 1200 sq. ft.

10/ A superimposed graphic presentation of the suggested enclosure around Vaughn machines appears at p. 24 of exhibit C-8(a).

In his report (Exh. C-8(a) pp. 20-23), Meyerson fully describes the suggested enclosure of the source of materials for its construction.

The second method of abatement is to separate the machines at great distances. This would consume tremendous space in the work area (Tr. 91).

Meyerson reported that the source of noise cannot be effectively treated (Exh. C-8(a) p. 20).

Meyerson expressed the opinion that a conservative estimate of the time needed for respondent to effect any of the suggested controls is one and one-half years (Tr. 92); two weeks of which would be shut-down time (Tr. 92).

In response to questions on cross-examination, Meyerson said that in concluding that engineering controls were feasible he gave consideration to machine operation and maintenance (Tr. 103); that he has no idea how many times a day the machine operator would have to open and close the doors of the suggested enclosures (Tr. 104); that the machines would be accessible for changing spools (Tr. 104); and that relative to machine maintenance access to the machines would be rapidly had whether the enclosures were made of bi-fold or sliding doors (Tr. 105).

Respondent's vice-president for manufacturing, Stewart W. Barrett[11] has been employed by the company for 19 years.

---

11/ Mr. Barrett is a chemical engineer, and holds degrees in chemical engineering and science.

Twelve of those years were devoted to research and development. In his opinion,[12/] the engineering controls (enclosures) outlined by Meyerson were not feasible from a maintenance point of view (Tr. 150).[13/]

According to Barrett, the operator assigned to the Vaughn machine area generally is responsible for an aisle which has five machines on each side (Tr. 158). Generally, seven to ten machines are in operation (Tr. 159). From the operational viewpoint, the suggested enclosures are not feasible based on the operator's duties. These duties are summarized (Tr. 161) as follows: The operator who must work from the aisle (Tr. 160), has to change 180 finished spools, an average figure (Tr. 171), in an eight-hour shift; check each spool approximately twice or 360 times during the shift and change 15 supply reels. From these duties, Barrett reasoned that the operator would have to open and

---

12/ This witness' testimony was augmented by reference to a blueprint of part of the Vaughn machine area (Exh. R-3) and nine photographs (Exh. R-4(a) to (i)) keyed to the machines depicted on the blueprint.

13/ Although witness limited his answer to maintenance, all of his testimony beginning at Tr. 157 and ending at Tr. 161 relates to operational feasibility.

close the bi-fold doors of the suggested enclosures 500 times before starting production work (Tr. 161). Barrett concluded that this means a door will be open six hours of the eight hour shift (Tr. 165) with the operator in front of it (Tr. 197) not taking into account the time another enclosure door would have to be open for maintenance work (Tr. 166).

Barrett explained that while a machine in an enclosure would be shut down for maintenance, others in the enclosure would be running (Tr. 205).

On cross-examination, Barrett stated that he feared the operator would be exposed to excessive sound because of the open doors (Tr. 198).

Relative to the maintenance of the Vaughn machines, Barrett characterized the suggested enclosures as a "virtual nightmare" (Tr. 162) and questioned how a four inch wide vertical panel, as suggested by Meyerson, could be installed between the drive motors in the back to back area since the available space is one and one-half inches to three inches (Tr. 162). He foresaw other problems (Tr. 162) ranging from general maintenance to changing motors. Also a hazardous condition if any employee is within an enclosure and the bi-fold door is accidently closed (Tr. 168).

Concerning the use of a folding vertical door in lieu of the bi-fold type, Barrett did not believe such a unit could be used. He explained that there was no way to support the sides for such a door and further the area over many of the machines was a mezzanine and pipes (Tr. 203).

Cross-examination elicited from Barrett that his major concerns were the lack of available space and that the enclosures would slow production (Tr. 204).

On redirect examination, Meyerson stated a sliding door could also be used for the enclosure (Tr. 211). However, on cross-examination, he said it would block access to the next door machine (Tr. 213).

Meyerson never saw any of the various doors he suggested used for wire manufacturing (Tr. 214).

## DISCUSSION

The respondent timely filed its answer denying various paragraphs of the complaint. Paragraphs I, II and III which relate to the respondent's engaging in interstate commerce and the Commission's jurisdiction are not denied.[14/] Accordingly, I find the respondent is engaged in commerce and the Commission has jurisdiction.

---

14/ Under 33(b) of the Commission's Rules of Producure, allegations in the complaint not answered are deemed admitted.

Building #19

The first issue for decision is whether the complainant has shouldered his burden of proof that respondent's employee assigned to the Watson stranding machines 217-06 and 216-05 is exposed to excessive noise levels during the eight-hour work shift. Secretary v. Love Box Co., Docket No. 6286 (4/17/76); Secretary v. Reynolds Co., Docket No. 1551 (2/25/76). Thus it must be shown that (a) the noise was greater than the permissible levels set forth in Table G-16 of the standard and (b) that respondent failed to utilize feasible administrative or engineering controls to reduce the noise levels to which the employee is exposed.

The complainant's evidence shows that when the initial inspection was made on October 31, 1975, the operator of Watson machines 217-06 and 216-05 was exposed to a noise level range of 101 to 103 dba - far in excess of the allowable 90 dba. Thereafter and before the second inspection, repairs were made to 216-05 lowering its noise level to below the allowable 90 dba.

It follows therefrom that there are feasible engineering controls available for the Watson strander machines in building #19. Respondent's contention that it would cost from $50,000 to $80,000 to repair machine 217-06 does not

render the proven controls economically infeasible. Respondent does a $450,000,000 volume of business annually.[15/]

The more troublesome question is whether or not a violative condition continues to exist where, as a result of the repairs to 216-05, the noise level when both machines are operating is lowered to a range of 85.5 dba to 94 dba. The answer requires an analysis of the evidence of the noise levels to which the machine operator is exposed while he is carrying out his various duties. During the eight-hour shift, he spends 1-1/2 hours attending one of the machines which is shut down. Regardless of which machine is not running, the operator is not exposed to excessive noise. This is so because the operator is not adversely affected by the noise from 216-05 (Exh. 8(a) p. 13) and of course when 217-06, the unrepaired machine is down, no noise is generated from it. For another 1-1/2 hours of the shift, the operator walks the aisle between the machines and when both were in operation, he is exposed to a noise level that ranges from 85.5 dba to 94 dba.

However, the record contains neither noise test readings taken at the log desk where the operator spends

---

15/ Kunkle at Tr. 144.

the remaining five hours of the eight-hour shift nor any probative evidence from which it can be gleaned what is the noise level at that location.

Exhibit C-8(a), figure #1, shows the log desk is located to the left of points ABC where readings were taken of the unrepaired machine 217-06. They showed 87, 89.5 and 93 dba respectively (Exh. C-8(b). However, the log desk is located in the middle of the 15-foot wide aisle - seven and one-half feet removed from the sources of the recorded noise. Under those circumstances, it cannot be reasonably found that the same levels of noise exist at the log desk. They are unknown quantities. Nor is the conclusion in the Galson Report[16/] (Exh. C-14, p. 56) that the operator of the machines would be overexposed even if he stayed at the log desk all day any help. It was prepared at a time prior to when the repairs were made to machine 215-06. The conditions under which the report was made no longer exist.

In summary, the record shows that during an eight-hour shift, the machine operator is not exposed to excessive noise for 1-1/2 hours, for another 1-1/2 hours he is overexposed only part time (the range is 85 to 94 dbs) and for the major part of his shift, five hours, the noise level to which he is exposed is not established.

---

16/ Noise Survey and Recommendations prepared August 1974 for respondent by Galson Technical Services, Inc.

A showing of excessive noise can be made by the use of spot readings if other evidence shows that exposure of employees to the noise levels so measured existed for a period of time in excess of that permitted by the standard 29 CFR 1910.95(b)(1). Sun Shipbuilding and Drydock Co., 11 OSAHRC 171 (1974). Complainant's case lacks the "other" evidence.

On this record, I cannot conclude that the complainant has proven by a preponderance of evidence that the respondent's employee while operating the Watson stranders in building #19 is exposed to a noise level in excess of the allowable 90 dba. The preponderance of evidence rule is applicable. Olin Construction Co. v. OSAHRC, 525 F2d 464 (2nd Cir., 1975); Secretary v. Armor Elevator Co., 5 OSAHRC 260 (1973).

In order to dispose of all the issues and to assist both parties, we indulge in an assumption. Assume that testing in the log desk area was done and showed an excessive noise level. Then and in that event, the respondent could come into compliance by administrative controls. This is clearly established by the complainant's evidence that all is required administratively, is to move the log desk to a place in the aisle where the dba is 86 (Tr. 68).

Respondent's contention that it was prejudiced by the introduction of complainant's exhibit 8(b) is totally without merit. Respondent was afforded full and adequate opportunity to examine the exhibit and stated for the record that it had no objection to it. Equally lacking in merit is the argument that the government is estopped from relying on the information in exhibit 8(b).

Building #16

Bartell-Watson Area

Respondent concedes that complainant has established that there is, in this area, a noise level in excess of the allowable 90 dba and that there are effective engineering controls.

It challenges the reasonableness of the one year allowed within which it must abate and seeks three years. Respondent argues that many more machines will have to be enclosed to reduce the noise level than complainant suggests and that it will be more costly (Respondent's brief p. 7, 8).

Respondent's plea for an extension of abatement time is supported by complainant's expert. In Meyerson's expert opinion, respondent should be given at least one and one-half years and not one year within which to abate. The question then is how much more time, if any, does the evidence support.

We are, in this area, concerned with 24 machines. Twenty-one are manufactured by Bartell and three by Watson.

Respondent makes much of the need for experimentation to fabricate an enclosure for the machines. It apparently has overlooked the uncontroverted fact that for the Bartell machine manufacturer offers commercial enclosures for the stranders respondent is using (Exh. 8(a) p. 14). It may

well be that respondent, if it wishes to avail itself of these enclosures, can more quickly abate as to these machines.

For the remaining three machines, the Watsons, respondent will have to fabricate enclosures since none are commercially available (Exh. 8(a) p. 14).

Considering all of the factors and arguments of both parties, I conclude that a reasonable abatement period is two years from the date this order becomes final.

Cook and Butt Area

The complainant's evidence fails to establish that in this area the respondent's employees are exposed to a noise level in excess of the allowable 90 dba. The violation of 29 CFR 1910.95(b)(1) is not shown.

Vaughn Fine Wire Area

Respondent concedes that the noise level in this section of its plant exceeds the level prescribed in Table G-16. It argues that notwithstanding complainant has not proved there are feasible engineering or administrative controls to bring the noise levels with the limits of Table G-16. (Brief p. 2) (emphasis added)

The Commission has consistently rejected this interpretation of 29 CFR 1910.95(b)(1). Secretary v. Continental

Can Co., no. 3973, et al (8/24/76); Secretary v. Turner Co., No. 3635 (8/24/76); Secretary v. Anheuser-Busch, Inc., No. 10609 (1/13/77). In Continental, the Commission said:

> "The standard requires the implementation of feasible engineering or administrative controls, and then goes on to provide for the use of personal protective equipment 'if such controls fail to reduce sound levels within the levels of Table G-16'. The standard thus contemplates that there will be some situations where engineering or administrative controls are to be considered feasible even though they fail to reduce the noise below G-16 limits."

Considered within the context of these rulings, respondent's argument lacks merit.

Respondent argues further that the suggested engineering controls are impractical and therefore not feasible, citing Secretary v. Anchor Hocking Co., 3 OSAHRC 1389 (1975).[17/]

Complainant's acoustical expert offered two methods to reduce the noise level of the machines in this area. His suggestion that the machines be separated at great distances is quickly disposed of. Respondent does not have the space required to adopt this approach to abatement. The recommended method of abatement is unrelated to the realities of the respondent's physical plant. It is rejected as infeasible.

---

17/ The members of the Commission are equally divided on this case. It has no precedented value. Secretary v. Garcia Concrete Co., 18 OSAHRC 184 (1975).

We examine the feasibility of full enclosures for groups of the Vaughn machines - the second method.

The evidence shows that an enclosure of the type Meyerson described can be fabricated from readily available materials and at economical cost. Unquestionably, some problems will be encountered in their construction, as contended by respondent. However, it is not shown that the anticipated construction problems are insurmountable.

The evidence further demonstrates that the use of enclosures with doors closed will effectively reduce the noise level emitting from the machines. Complainant's evidence that a 10 to 15 dba reduction would result from their use is unrebutted.

From this it can be fairly concluded that the use of enclosures would provide some protection from the high levels of noise in the Vaughn machine area.

I concluded that the use of enclosures is a "feasible" engineering control of the type contemplated by 29 CFR 1910.95(b)(1).

In reaching this conclusion, I do not overlook the respondent's argument that considering the employee duties and machine maintenance requirements, the installation of enclosures would be a useless act. Respondent mistakenly relies upon the Anchor-Hocking case (supra)

which is neither persuasive nor has precedential value.[18/] It seeks to buttress its position with the erroneous interpretation that the controls are per se not feasible unless they would reduce the noise levels to within G-16 limits (Continental Can and Turner Co. cases, supra, at pp. 25-26).

Indeed it does not improve respondent's position that the survey which it commissioned concluded that a partial enclosure of the Vaughn machines would bring the operator's exposure to within the allowable limits (Exh. C-14, p. 107).

Respondent further defends on the ground that the use of an enclosure would create a hazardous condition by reason of a door being accidently closed with the employee within. The defense is properly raised. Secretary v. Steel Erectors, Inc., 6 OSAHRC 154, 156, but lacks substance. It is highly speculative.

Economic considerations cannot be disregarded in determining feasibility. Secretary v. Republic Granite Co., Docket No. 7359 (9/30/76). Respondent's contention that to enclose the machines would adversely effect production by slowing it down is not supported by that quality or

---

18/ See FN 17.

quantity of evidence which would warrant a finding that the engineering controls would be infeasible.

Respondent's challenge to the validity and accuracy of the readings taken by Meyerson is rejected. It is concluded the readings were both accurate and reliable.

Unlike the Bartell-Watson area, the respondent does not have the advantage of an enclosure made by the machine manufacturer (Exh. 8(a) p. 20). Although panels from which enclosures can be made are available to respondent there are problems to overcome . Thence, time to experiment is needed before the 20 machines can be enclosed. As stated elsewhere, in this opinion, complainant's expert rejected the one year abatement period provided for in the citation. I conclude from all of the available evidence that a reasonable abatement period is two years and six months from the date this order becomes final.

Complainant does not seek any penalty. Its position is supported by the record. It is reasonable and proper.

Having heard the testimony and observed the demeanor of the witnesses, and having considered the same, together with the citations, notification of proposed penalty, notice of contest, pleadings, representations, stipulations and admissions of the parties, it is concluded that the preponderance of evidence, on the entire record, supports the following:

Building #19

1. That feasible engineering and administrative controls can be utilized to reduce the noise level of the Watson strander machines in building #19.

2. That the cost of such engineering and administrative controls for the Watson stranders do not make them infeasible.

3. That during one and one-half hours of the eight-hour shift, the Watson machine's operator is not exposed to excessive noise levels and for one and one-half hours he is only partially exposed.

4. That there is no evidence from which it can be determined whether or not the Watson machine's operator is exposed to noise in excess of 90 dba for the eight-hour shift because there are no readings of the noise to which he is exposed to for the five hours he spends at the log desk.

Building #16

5. That feasible engineering controls necessary to reduce the noise level emitting from the machines in the Bartell-Watson area can be reasonably accompolished within two years.

6. The evidence does not establish that the employees in the Cook-Butt area of building #16 are exposed to noise in excess of the allowable 90 dba.

7. That feasible engineering controls can be utilized to reduce the noise level of the Vaughn machinery in building #16.

8. That there are no administrative controls that can be utilized to reduce the noise level of the Vaughn machinery in building #16.

9. That the feasible engineering controls necessary to reduce the noise level of the Vaughn machinery can be reasonably accomplished within two years and six months.

10. The test equipment used by Mr. Meyerson and the readings they produced were reliable and accurate.

## CONCLUSIONS OF LAW

1. The respondent is, and at all times material hereto, was engaged in a business affecting commerce within the meaning of section 3(5) of the Occupational Safety and Health Act of 1970.

2. The respondent is, and at all times material hereto, was subject to the requirements of the Occupational

Safety and Health Act and the standards promulgated thereunder and the Commission has jurisdiction of the parties and of the subject matter herein.

3. That the respondent was not, with respect to the Watson stranders in building #19, in violation of section 5(a)(2) of the Act, 29 U.S.C. 654(a)(2) or 29 CFR 1910.95(b)(1).

4. That with respect to the Bartell-Watson area in building #16, respondent violated section 5(a)(2) of the Act, 29 U.S.C. 654(a)(2) by failing to comply with 29 CFR 1910.95(b)(1).

5. That the respondent, in the Cook-Butt area of building #16 was not in violation of section 5(a)(2) of the Act, 29 U.S.C. 654(a)(2) or 29 CFR 1910.95(b)(1).

6. That in the Vaughn Fine Wire area of building #16, the respondent violated section 5(a)(2) of the Act, 29 U.S.C. 654(a)(2) by failing to comply with 29 CFR 1910.95(b)(1).

## O R D E R

Those parts of the citation which charge respondent with failure to comply with 29 CFR 1910.95(b)(1) in the Watson area of building #19 and in the Cook-Butt area of building #16 are vacated. Those parts of the citation which refer to a violation of said standard in the Bartell-Watson and Vaughn Fine Wire areas of building #16 are affirmed.

The multi-step abatement period of the violation is modified to the extent of advancing the period from one year to two years in the Bartell-Watson area and to two years and six months in the Vaughn area from the date this order becomes final.

No penalty is assessed.

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>KIN-BUC, INCORPORATED,<br>Respondent. | OSHRC Docket No. 76-2769 |

ORDER OF REMAND

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

On December 17, 1982, the Commission issued its decision in Sun Ship, Inc., OSHRC Docket No. 16118. In accordance with the decision of the U.S. Supreme Court in American Textile Manufacturers Institute, Inc. v. Donovan, 101 S.Ct. 2478 (1981)("ATMI"), the Commission held that "feasible" under the occupational noise standard means achievable. The Commission overruled the cost-benefit test of feasibility previously set forth in Continental Can Co., 76 OSAHRC 109/A2, 4 BNA OSHC 1541, 1976-77 CCH OSHD ¶ 21,009 (No. 3973, 1976), appeal withdrawn, No. 76-3229 (9th Cir. Apr. 26, 1977), and substituted a test consistent with ATMI.

In view of this intervening change in law, the judge's decision with respect to item 3 of citation 1 is vacated. The case is remanded for further proceedings, including evidentiary submissions, so that the interrelated issues of technological

and economic feasibility can be reconsidered in light of the test of feasibility established by Sun Ship, Inc. 1/

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.
Executive Secretary

DATED: DEC 17 1982

1/ Chairman Rowland dissents. He would vacate item 3 because the requirement in section 1910.95(b)(1) that feasible administrative or engineering controls be utilized is invalid. See his dissenting opinion in Sun Ship.

DECISION AND ORDER

DeBenedetto, Judge.

This is a proceeding pursuant to section 10 of the Occupational Safety and Health Act of 1970 (29 U.S.C. et seq.,

hereinafter called the Act) stemming from three citations issued by complainant against respondent under authority provided by section 9(a) of the Act.

The citations and notification of proposed penalty, issued on June 11, 1976, are based on an inspection made during the period from March 13 to June 4, 1976, of a "chemical and solid waste landfill" in Edison, New Jersey. Citation number 1 alleged nonserious violations of various general industry safety standards* designated in the citation as items 1 through 18; item 3 involved the occupational noise standard 29 CFR § 1910.95(b)(1). The penalties proposed for citation number 1 totaled $2,635.00, including $290.00 proposed for item 3. Citation number 2 alleged serious violation of 29 CFR § 1910.106(e)(6)(i) for which a $750.00 penalty was proposed. Citation number 3 alleged serious violations of 29 CFR §§ 1910.1017(c)(2), (f)(1), (f)(2) and (f)(3), for which a $750.00 penalty was proposed. Respondent contested the three citations as well as the proposed penalties.

## STIPULATED SETTLEMENT

The parties entered into a Stipulated Settlement (J-15) regarding the three citations and proposed penalties excepting

---

*Section 5(a)(2) of the Act, 29 U.S.C. § 654(a)(2), requires each employer affecting commerce to "comply with occupational safety and health standards promulgated under this Act".

only said item 3 and the proposed penalty of $290.00. Pursuant to the agreement, complainant moved to amend the notification of proposed penalty and complaint to reflect a reduction in the proposed assessment of penalties for the three citations from a total of $3,845.00 to $1,845.00. In consideration thereof, respondent has moved to withdraw its notice of contest and answer to the citations, notification of proposed penalty and complaint as modified, except as to item 3 of citation number 1.

The record reflects (1) abatement of the violations has been accomplished according to an affidavit incorporated into the Stipulated Settlement; (2) assurance of continuing compliance by respondent; (3) agreement to pay the amended proposed penalties; and (4) adequate notice to affected employees.

The Stipulated Settlement being in accord with the purposes and objectives of the Occupational Safety and Health Act of 1970, it is hereby approved and the motions contained therein are granted.

The only issues remaining are whether respondent violated 29 CFR § 1910.95(b)(1), as alleged in item 3 of citation number 1, and if so, what is the appropriate penalty. These matters were heard on May 19 and May 20, 1977, in Newark, New Jersey.

## OCCUPATIONAL NOISE STANDARD IN ISSUE

§ 1910.95(b)(1) provides:

> "When employees are subjected to sound exceeding those listed in Table G-16,[1] feasible administrative or engineering controls shall be utilized. If such controls fail to reduce sound levels within the levels of Table G-16, personal protective equipment shall be provided and used to reduce sound levels within the levels of the table."[2]

## ADMISSION

Respondent admitted that the Commission has jurisdiction of the matter in issue pursuant to section 10(c), 29 U.S.C. § 659(c) [Tr. 4].

---

1/ Table G-16 - Permissible Noise Exposures

| Duration per day, hours | Sound Level dBA slow response |
|---|---|
| 8 | 90 |
| 6 | 92 |
| 4 | 95 |
| 3 | 97 |
| 2 | 100 |
| 1-1/2 | 102 |
| 1 | 105 |
| 1/2 | 110 |
| 1/4 or less | 115 |

2/ The citation alleges that four out of five "heavy equipment operators" exposed to excessive sound levels were not wearing protective equipment; and that "[f]easible engineering and/or administrative controls were not determined or implemented". Correction of the condition by means of personal protective equipment (as "interim protection") was to be accomplished "immediately." July 10, 1976, was specified as the date "by which alleged violation must be corrected," presumably by "feasible engineering and/or administrative controls."

By post-hearing motion, complainant moved "to amend the final abatement date for the alleged violation of the noise standard 29 CFR 1910.95(b)(1) from July 10, 1976, to July 1, 1978." The unopposed motion is hereby granted.

**TESTIMONY OF MICHAEL McGUINNESS**
**OSHA'S INDUSTRIAL HYGIENIST**

Mr. McGuinness inspected respondent's worksite in Edison, New Jersey, during the period from March 13 to June 4, 1976. The operations involved primarily solid waste landfill which was described as mixing solid waste with dirt, "a method of recycling garbage" (Tr. 14). In May 1976, he tested six units of respondent's earthmoving equipment for sound levels including bulldozers and "pans" (Tr. 16-17, 19). Five of the 6 pieces of equipment were in violation of the standard of permissible sound levels. The bulldozers were smaller than the "pans" and one of the bulldozers, which had a "soundproof cab," was in compliance with the noise standard (Tr. 17-19, 22). Bulldozer "No. four" produced sound levels ranging from 90 dBA "when it was idle" to 102 dBA during reverse and forward movements, and up to 105 dBA when moving earth (Tr. 20). Bulldozer "No. three" produced the following sound levels: 92 dBA while "idling," from 103 to 107 dBA during reverse and forward movements, and 103-105 dBA when moving earth (Tr. 21). The "D-5" bulldozer produced the following sound levels: 90 dBA while "idling," 100-102 dBA during reverse and forward movements, 100-102 dBA while moving earth (Tr. 21-22). The sound levels produced by one "pan" ranged from 92-95 dBA while "idling" to 104-106 dBA during "an empty run." The second "pan"

that was tested measured 92-95 dBA while "idling," 100-105 dBA during "an empty run," and 104-106 during a "full run" (Tr. 21). Measurements of "the dozer with the soundproof cab on it" disclosed the following results (Tr. 22): "Moving forward it was 85 to 90 [dBA]. Pushing the pans with the windows closed was 90. Pushing pans with the windows open it was 92. Idling with the windows closed was 85 and backing up with the windows closed was 93 to 95." When asked to describe how the other machines "differed from this particular bulldozer" the following colloquy ensued (Tr. 23-25):

"A. From what I could notice, they did not have insulating materials and the windows were open. Most of the time the doors were wide open. So you really didn't have much of a barrier there at all.

Q. Did the other bulldozers have a cab structure?

A. Yes.

Q. How about the pans? Did they have cab structures also?

A. Well, a shell, a basic shell type of cab, yes.

* * *

THE COURT: Mr. McGuinness, please clarify your description of the equipment that you say the doors were open. Did they have doors?

A. Yes.

THE COURT: You mean the operator just happened to leave the door open?

A. No. You could tie it back. On a hot day it gives you more air because it's pretty hard to sit in the cab and not have any air movement and do the job when it's pretty hot out on the lift. The lift being the dump.

THE COURT: Well, supposing the pieces of equipment that had the windows open and doors open, supposing the doors and windows were closed. Would that have rendered the equipment in compliance with the noise standard?

A. Well, I'd only be giving you my opinion because I really couldn't say.

THE COURT: You couldn't say?

A. No.

THE COURT: Well, I'm just wondering if we have a problem here of easy compliance simply by rolling up the windows and closing the doors.

Is that the kind of a situation that we have? . . .

A. Well, I don't think simply by closing the doors and windows that it would reduce the noise fully because you don't have any insulating material or absorbing material. It would definitely lower the levels. How much, I don't know."

Of the six employees operating the equipment, "five were not wearing their hearing protection" (Tr. 27) although [a]ll of them had hearing protection in the cab" (Tr. 32).* When the witness discussed during the inspection the need for exerting more control over the employees "to insure that they wear the

---

*A discrepancy exists as to whether four or five employees were allegedly not using personal protective equipment. The citation specifies that four out of five equipment operators were not using personal protection. McGuinness's testimony reflects that one of the six machines tested had a "soundproof" cab, therefore, only five operators would require personal protective equipment.

personal protective equipment," respondent's employee "in charge" replied that "he thought it would be a good idea and he would take care of it" (Tr. 29). No administrative controls were utilized to reduce the noise exposure; the employees operated the equipment "about five to six hours minimum" (Tr. 31-32). The witness felt that respondent's equipment should be retrofitted with sound suppressed cabs that "are available to owners of this heavy equipment . . .," a feasible engineering noise control accomplished by either "[m]odifying the existing cab with sound absorbing material or getting an entire new cab already fitted with the sound absorbing material" (Tr. 32-33). Two sources of such devices are Tube-Lok Products and Caterpillar, the latter being the manufacturer of respondent's equipment (Tr. 35-36, Exhs. C-2, C-3). He did not know "the specifics" of respondent's equipment (Tr. 35), however, "[s]peaking with the people from Tube-Lok, they couldn't give me any specific information unless they knew the exact serial number, model number, year of manufacture for the pieces of equipment; but in general, I got a quote from them, somewhere, you know, depending on what you would want, anywhere between $3,000 and $6,000 per cab for everything you'd want" (Tr. 37). Those prices did not include an air conditioner which "more than likely" would be needed (Tr. 69). In assessing the amount of the proposed penalty for violating the noise standard, he gave a 10 percent credit for "good faith," 5 percent was

allowed for "size" based on the fact that respondent employed 23 persons, and 10 percent was given for "history," the respondent having been previously cited for other violations (Tr. 42-43).

On cross-examination the witness testified that at the time of his inspection, the weather was "warm." He did not know whether the machines were equipped with air conditioners and he did not inquire as to whether respondent's equipment had air conditioning (Tr. 57). He acknowledged that his knowledge of retrofitting respondent's equipment was limited to Tube-Lok's sales literature (Tr. 64), and he did not know whether or not Tube-Lok's noise control kits were available for the specific pieces of equipment owned by respondent (Tr. 67).

## TESTIMONY OF ROBERT MEAGHER
## RESPONDENT'S PRESIDENT AND TREASURER

Respondent is a public utility of the State of New Jersey and as such is required to file a Certificate of Public Convenience. Since July 1976 respondent has ceased dealing in chemical waste as a result of an agreement with the New Jersey Department of Environmental Protection. Substantially all the equipment owned or operated by respondent was manufactured by the Caterpillar Company and it consists of bulldozers, front

end loader, earthmoving pan and a garbage compactor (Tr. 82). The pan or "Wheel Tractor-Scraper" shown in the brochure, Exhibit R-1, offers a sound suppression cab which is a feature offered only relatively recently (Tr. 84). The bulldozer or "Track-type Tractor" shown in the brochure, Exhibit R-2, is a current model which also offers a sound suppression cab. Respondent's bulldozers were older models except one which was the new model with sound suppression cab purchased by respondent in 1976 (Tr. 98) and which was found to be in compliance with the noise standard during the OSHA inspection (Tr. 85). The cost of the cab was approximately $6,000.00 (Tr. 99). The front end loader or "Track-type Loader" depicted in the brochure, Exhibit R-3, is the current model; respondent owns the older model (Tr. 86). He stated (Tr. 87): "We continually replace equipment in the landfill business. It's a reasonably tough service and the earlier pieces were acquired in 1973. Some were acquired in 1974. Two pieces in '75, two items in '76 and one in '77." Respondent has "[a]pproximately ten" pieces of heavy equipment (Tr. 97). Respondent has been operating at a loss since 1975 (Tr. 88-89, 104). The rates that respondent may charge its customers are regulated by the Public Utility Commission of New Jersey. Rates are based on fixed assets and "working capital" (Tr. 90-92). Any addition or renovation done to equipment that did not add materially to the useful life of

the equipment such as making cab alterations, would not be included in the "rate base" (Tr. 92-93). All of respondent's equipment have enclosed cabs, most of which were installed by respondent's own maintenance shop, therefore, they were not of "standard issue" or size (Tr. 93-95). He prefers to have equipment with sound suppression cabs, and respondent has "always followed the program of continually renewing the fleet . . . by adding one or two pieces a year rather than . . . have it all fall apart at [the same time] . . ." but it was questionable whether respondent would be able to afford it (Tr. 101-102). Sometime after the OSHA inspection, respondent established a set of safety rules the violations of which are subject to disciplinary action. The rules include requiring the wearing of protective devices such as ear muffs or plugs (Tr. 206-209, Exh. R-7). He stated that "[s]ubject to our economic feasibility, it would be our intention to purchase new sound suppressed equipment. We already purchased one. We're reasonably pleased with the results of it . . .[during] the ten year operating history of Kin-Buc, we started out by buying basically machines that had 10,000 hours on them and investing a certain amount to get them updated; primarily because we're operating on a garbage dump and we didn't think we needed a new D-8 [bulldozer] on a garbage dump, but over the

period of years we have . . . reached the conclusion that if you can, it's more desirable to use new equipment even on a garbage dump . . . [because of] down time and the cost to repair and maintain" (Tr. 211-212).

## TESTIMONY OF BERNARD RABINOWITZ RESPONDENT'S CONTROLLER

In 1975 respondent had an annual loss of $50,200.00 after income taxes, and $138,800.00 before income taxes. In 1976 the pre-tax loss was $486,800.00 and $383,300.00 after taxes. During the first quarter of 1977 there was a loss of $175,000.00. Respondent has been operating at a loss ever since its operations had been restricted (Tr. 125-126). The depreciable life of respondent's heavy equipment has varied from three to seven years, depending on whether it was purchased used or new. It is common accounting practice to "expense out" any equipment expenditures that did not extend the life of the equipment (Tr. 127-128). If capitalized, the equipment betterment item is included in the rate base, but if the item is "expensed out" it is not included in the rate base (Tr. 129). At the present time respondent is insolvent and its financial condition would not improve under "present levels of operation" due to "a restraining order that limits the amount of waste that we can receive . . ." (Tr. 130-131).

TESTIMONY OF CURTIS STOKES
VICE PRESIDENT, FOLEY MACHINERY COMPANY

Mr. Stokes heads the parts and service departments and is familiar with various types of equipment including Caterpillar where he was formerly employed in sales (Tr. 141-142). Foley Machinery is one of the two Caterpillar dealerships existing in the State of New Jersey with Foley handling the northern area of the State (Tr. 143). Although machines have been retrofitted for rollover protection, Foley has not retrofitted any Caterpillar machine for sound suppression (Tr. 153-154). In order to be effective, a sound suppression cab requires an air conditioner (Tr. 157). In order to retrofit respondent's present equipment for sound suppression it would be necessary to proceed in stages depending upon the results achieved (Exh. R-6). The estimated cost of the initial stage including the air conditioner is $7,500.00. If the first stage did not reduce the sound levels to permissible limits, then the second-stage modifications would be installed also at an estimated cost of $7,500.00. If the third-stage modifications are instituted in order to achieve permissible sound levels, the cost is estimated to be an additional $23,000.00 (Tr. 166-175). Caterpillar also has available for certain bulldozers a sound suppression cab unit that "could be adopted with possibly very

expensive modifications to fit the D-8 machines that Kin-Buc currently owns" (Tr. 175). Such a unit including air conditioner would cost about $15,000.00-$16,000.00 plus the cost of making modifications that would be likely necessary (Tr. 177-178). Installing or retrofitting sound suppression devices does not prolong the useful life of the machine (Tr. 180). The prices for the purchase of new equipment with sound suppression cab and air conditioner are as follows: about $150,000.00 for a Track-type Tractor (or bulldozer); approximately $100,000.00 for a Track-type Loader; and $250,000.00 for a Wheel Tractor-Scraper [or pan] (Tr. 178). A new bulldozer may be purchased with just a simple canopy and the price for the canopy is $4,000.00; the price for an enclosed cab with sound suppression and air conditioner is about $11,000.00. The prices for such optional factory installed equipment are "somewhat less" for the loader and scraper (Tr. 192-193). The operational life of a machine depends on its use and maintenance. Generally, a machine has a life of about 10,000 hours of operation and the average rate of operation is approximately 1,500 hours per year (Tr. 179). The sound suppression cab does not reduce the amount of noise created by the machine during its operation it merely deflects the noise from the operator (Tr. 182). The cost of leasing a bulldozer would be at least about $6,000.00 per month, and $10,000.00-$12,000.00 per month for a scraper [or pan] (Tr. 185-186).

DISCUSSION

Respondent Kin-Buc, Inc., a public utility company, is engaged in the operation of a landfill site in Edison, New Jersey, for the purpose of collecting and disposing of commercial and industrial waste products. In the course of its operations it utilizes heavy earthmoving equipment, including bulldozers, scraper (or "pan") and loader manufactured by Caterpillar Tractor Co.

McGuinness, an industrial hygienist, conducted a survey of sound levels emanating from six pieces of respondent's earthmoving equipment, five of which were found to have noise levels in excess of those listed in Table G-16 of 29 CFR § 1910.95, the equipment being operated by respondent's employees a minimum of "about five to six hours" per day. During the inspection, McGuinness observed that although personal hearing protective devices (in the form of ear muffs or ear plugs) were present in all equipment cabs tested, only one operator was actually wearing such protection while operating the equipment.

Although all six machines were equipped with cabs,[3/] only one had a sound suppression cab and met the permissible sound levels of § 1910.95(b)(1). Tests of noise levels of the five other

---

3/ The equipment manufacturers' brochures introduced into evidence by both parties (Exhs. C-2, C-3, R-1, R-2, R-3 and R-5) indicate that the primary purpose of the equipment cab is to afford the operator a rollover protective structure ("ROPS"), and that the cab is available with sound suppression.

units were made by McGuinness while the windows and doors of the cabs were open. This was apparently due to the absence of air conditioners and the resultant operator's discomfort without the flow of air through the opened windows and doors.4/

As a result of the inspection and noise survey conducted by McGuinness, respondent was cited for nonserious violation of § 1910.95(b)(1) because (a) of the five employees exposed to excessive sound levels, only one was wearing personal protective equipment, and (b) "[f]easible engineering and/or administrative controls were not determined or implemented".

In its brief respondent argues that the citation should be vacated because: (1) "the Secretary has failed to establish the technical feasibility of engineering or administrative controls;" (2) "the engineering and administrative controls required are economically infeasible;" and (3) "the Secretary has not met [his] burden of proof in showing that Respondent did not have an effective policy to insure the wearing of the personal protective equipment provided its employees". The last of these arguments will be considered first.

It is settled law that the Secretary has the burden of proving all elements of an alleged violation. Secretary v. Raymond Hendrix d/b/a Alsea Lumber Company, 511 F.2d 1139, 1142-1143 (9th Cir. 1975); 29 CFR § 2200.73(a). The standard

---

4/ The evidence clearly indicates that in order to effectively control the operator's noise exposure, a cab must be equipped not only with sound suppression materials but an air conditioner is also required for warm weather operation (Tr. 157, Exh. R-6).

29 CFR § 1910.95(b)(1) requires the use of feasible administrative or engineering controls whenever employees are exposed to sound levels exceeding those permitted by Table G-16. The use of personal protective equipment is required only if engineering or administrative controls are not feasible or cannot reduce noise exposure to within permissible levels. If engineering or administrative controls are not sufficient to reduce noise exposure to within permissible levels, such controls must be used to reduce exposure to the greatest extent feasible and must be supplemented by personal protective equipment to reduce sound within the prescribed limits. Secretary v. Turner Company, Division of Olin Corp., No. 3635 (August 24, 1976). Thus, while engineering and administrative devices constitute the primary means of controlling noise exposure, an employer may be issued a citation and held liable for penalties under the Act for violating the occupational noise standard when personal protective equipment has not been used to achieve compliance with the standard in the absence of feasible engineering or administrative controls.5/

---

5/ In its brief, (p. 13), respondent rather tenuously argues that "the issue as to whether or not employees were in fact wearing the protective devices may be irrelevant when considering whether or not the citation issued by the Secretary should be vacated". The cases cited by respondent (Secretary v. Weyerhaeuser Company, No. 11869 September 14, 1976), Secretary v. Peterson Manufacturing Co., Inc., No. 76-1314 (April 21, 1977), and Secretary v. Wheeling-Pittsburgh Steel Corp., No. 13949 (May 13, 1977)) do not support such a contention.

While the evidence clearly establishes that respondent provided ear protective equipment to its employees, it is equally plain that respondent did not undertake to seriously enforce the use of such equipment by its employees until sometime after the compliance officer made his inspection.[6/] The lead opinion of Commissioner Cleary in Secretary v. B-G Maintenance Management, Inc., No. 4713 (June 1, 1976) spoke specifically on this issue:

> "We are not unmindful that under the Act an employer is not to be held strictly liable for all violations. We do not hold here that the employer must provide constant over-the-shoulder supervision for each of his employees, but we do hold that in order to fulfill its statutory obligation the employer must do more than issue adequate safety instructions, or

---

6/ Respondent apparently misconceives the personal protection requirements of the standard as evidenced by the following remarks made in its brief (p. 15):

> "Since . . . Mr. McGuinness testified that he did not conduct a systematic observation of the heavy equipment operators as to whether they were wearing the protective devices . . . it is entirely possible that the men sometimes wore the devices and sometimes did not, depending upon the weather and other operating conditions at the job site. Therefore . . . the Secretary has failed to meet his burden of proof in showing that an effective program of hearing conservation through the use of personal protective equipment was not employed by Respondent . . . ."

I should think it eminently clear that the standard's requirement of personal protective equipment is not conditioned upon the individual employee's comfort or discretion.

> hold safety meetings. J. A. McCarthy & Co., supra, note 2: The Leone Construction Co., No. 4090 (February 10, 1976). On the adequacy of safety instruction, see Ames Crane & Rental Service, Inc., v. Dunlop, No. 75-1591 (8th Cir., April 1, 1976). What is basically lacking here is an effective safety enforcement program reflecting a diligent effort to discourage, by discipline if necessary, violations of safety rules by employees. Warnel Corporation, No. 4537 (March 31, 1976). Section 5(a)(2) requires no less than this. See generally, Atlantic & Gulf Stevedores, Inc., No. 2818 etc., (April 11, 1975) (lead opinion), aff'd, No. 75-1584 (3rd Cir., March 26, 1976). To hold differently would mean that once an employer provides and instructs employees in the use of safety equipment, and issues orders regarding its use, employees are at liberty to disregard such orders. We believe that the adoption of such a position would fall short of the Congressional purpose." (Footnote omitted.)

The second ground relied upon by the Secretary in citing respondent for violation of the occupational noise standard, is the charge that respondent failed to utilize feasible engineering controls to reduce excessive sound levels.7/ Respondent contends that complainant has failed to establish that engineering controls are a feasible means of abatement. I agree.

McGuinness, the Secretary's only witness, testified as to the availability of engineering controls. He recommended that respondent's equipment be retrofitted with sound suppression cabs by either installing sound absorptive material in the existing cabs or replacing the equipment cabs with new sound suppression cabs. The estimated cost was "anywhere between

---

7/ The Secretary has not presented any evidence showing that feasible administrative controls are available to reduce noise exposure.

$3,000.00 and $6,000.00 per cab" without air conditioner. These recommendations were based primarily upon the sales literature supplied by Tube-Lok, a manufacturer of retrofit noise control systems for equipment cabs. McGuinness acknowledged that he did not know whether or not Tube-Lok's retrofit noise control systems were available for the specific pieces of equipment owned by respondent.

Stokes, Vice-President of Foley Machinery Company, testified that, although Foley is one of the two Caterpillar dealerships existing in New Jersey, no retrofitting of Caterpillar equipment with sound suppression had been done by Foley. His testimony also indicates that because of many uncertainties involved, retrofitting respondent's equipment would require step-by-step modifications depending on the sound levels achieved. The first phase involves installation of sound suppression material inside the cab and air conditioner at a cost of $7,500.00. In the event that the first phase failed to produce permissible sound levels, the second phase would be implemented by installing rubber mounts between the equipment cab and the main frame, and by installing special muffler group at an additional cost of $7,500.00. If a third phase were required to further reduce the level of sound, the additional cost would be $23,000.00. There was no assurance as to the extent of the sound reduction resulting from such modifications.

The second method of reducing the sound levels of respondent's bulldozers described by Stokes consists of replacing the existing cabs with sound suppression cabs at a basic cost of about $15,000.00 - $16.000.00 per unit plus the cost of making necessary modifications. The only other alternative is to purchase completely new machines[8/] with sound suppression cabs and air conditioners, sold by Caterpillar at the approximate price of $100,000.00 for a loader, $150,000.00 for a bulldozer and $250,000.00 for a scraper (or pan).[9/] The record indicates that permissible sound levels would be attained by either one of these two methods.

"Feasible engineering controls", as the term is defined by the Commission, means engineering controls which are both economically and technologically feasible. Engineering controls are technologically feasible if they will result in a significant reduction in ambient noise levels. In determining whether controls are economically feasible, all relevant cost and benefit factors must be weighed. Secretary v. Great Falls Tribune Company, No. 6632 (May 19, 1977); Secretary v. West Point Pepperell, Inc.,

---

8/ Another choice available to respondent is leasing. However, except for approximate monthly rental charges (which are substantial and appear to offer no cost advantage to respondent on a long-term lease basis), neither party presented any evidence on which to base a valid evaluation of the effects of equipment leasing as compared to outright purchase.

9/ The bulldozer's $150,000.00 price tag includes $11,000.00 for an enclosed cab with sound suppression and air conditioner; the price of a "simple canopy" type cab is $4,000.00. According to Stokes's testimony, the prices for such optional factory-installed equipment are "somewhat less" for the loader and scraper.

No. 8255 (April 18, 1977); Secretary v. Continental Can Company, Inc., No. 3973 (August 24, 1976).

Except for his reference to one of the tested machines having sound suppression cab, McGuinness's testimony concerning engineering controls was limited essentially to retrofitting devices manufactured by Tube-Lok, and here there is a complete absence of probative facts to establish the feasibility of Tube-Lok's noise control system. The Secretary's burden of proof is not satisfied simply by a showing that noise controls exist; the occupational noise standard is violated only if an employer fails to utilize those controls which are feasible in its operations. Secretary v. Great Falls Tribune Company, supra.

The undisputed testimony of Stokes indicates that retrofitting respondent's present machines by either (a) modifying the existing equipment cabs or (b) replacing existing cab units with sound suppression cabs, involves: In the first instance, costs ranging from $7,500.00 to $38,000.00 with no proof as to the extent of resultant noise-level reduction and no assurance of achieving a significant reduction in sound levels; and in the second instance, costs of $15,000.00 - $16,000.00 plus "expensive modifications" that may be likely to reach permissible sound levels.

It is significant to note that the average operational life of a machine is about seven years, and respondent's machines have had a "depreciable life" of three to seven years, depending on whether the equipment was purchased used or new. There is no evidence to indicate the operating condition or the expected

operational-life span of respondent's equipment. The evidence is clear that retrofitting with a noise control system will not prolong the machines' service life.[10/] Complainant would require respondent to expend substantial sums of money within a limited period of time to retrofit its present equipment regardless of its residual useful life.

It is clear from the record that the earthmoving machines under discussion are an essential part of respondent's waste products operations, and that the machines must be replaced at some time due to wear and tear inherent to such type of work. Caterpillar offers for sale new machines with optional equipment including air conditioner and a sound suppression cab which reduces sound levels to 90 dBA. The price of this optional equipment is approximately $7,000.00,[11/] almost equal to Foley's "phase I" estimated cost of retrofitting respondent's machines.

Is respondent required to retrofit its present machines to reduce sound levels? This procedure, which is advanced by the Secretary, is encumbered with technological as well as economic uncertainties. Is respondent required to purchase

---

10/ The evidence establishes that expenditures incurred by respondent for such modifications are not taken into account in ascertaining its public utility rate base.

11/ The amount of $7,000.00 represents the difference between the price of a rollover protective structure ("ROPS") cab ($4,000.00), which is required in certain cases by other safety standards, and the price of the sound-suppressed "ROPS" canopy with air conditioner ($11,000.00).

new machines equipped with sound-suppressed cabs and air conditioners in order to comply with the standard? It would appear that the Secretary has serious doubts concerning the feasibility of this latter course in view of his failure to present any evidence on this issue in support of his case.

Chairman Barnako summarized the concept underlying his lead opinion in Secretary v. Castle & Cooke Foods, Inc., No. 10925 (May 19, 1977):

> ". . . [the Secretary] approaches this case as if noise hazards and the abatement thereof should receive an employers' highest priority for allocation of its resources to the exclusion of all other health and safety hazards that may exist in the workplace. We note that the hazard involved herein was alleged to be nonserious, and the Secretary declined to propose a penalty. Excessive noise, however, is only one of numerous safety and health hazards the Act seeks to eliminate from workplaces, and other hazards pose serious debilitating threats and yet others are life threatening. Such serious hazards will also require resources for abatement, and obviously the benefits to be achieved will be great. We therefore cannot conclude that noise reduction should be assigned the priority suggested by the Secretary. Furthermore, we do not think that a specific employer's economic situation is particularly relevant in determining the feasibility of noise controls. If the question is whether an employer can 'afford' the controls, then employee health would depend on the financial condition of their employer. Instead, we think that in determining whether controls are feasible, we must realistically consider the hazard presented by excessive noise and determine whether the health benefits to employees from noise reduction justify the cost to the employer.

> "This approach is consistent with the purposes of the Act. The Act recognizes that perfect safety and health cannot be achieved, and that a balancing of costs and benefits must be made . . . ." [Footnote omitted.]

In applying the economic feasibility test in Castle & Cooke, it was concluded that controls capable of attaining a reduction from 98-100 to 90 dBA in the can plant, and from 95-96 to 90 dBA in the cannery for an 8-hour day were not economically feasible when, for each employee benefited, such controls would cost: in the can plant, $3,100.00 to install and $1,100.00 in increased annual costs due to production losses and maintenance; and in the cannery, $3,400.00 to install and $111.00 in annual production losses and maintenance.

The Castle and Cooke case is controlling here and leads to the conclusion that retrofitting respondent's earthmoving machines (either by making modifications to existing cabs or by replacing existing cab units with sound-suppressed cabs) or purchasing new machines with sound-suppressed cabs and air conditioners, is not economically feasible.[12/] It is also concluded that complainant has failed to establish that retrofitting respondent's machines by making modifications to existing cabs constitutes a technologically feasible control.

---

12/ The conclusion reached herein should not be interpreted by respcndent as a discordant note in its determination to "purchase new sound suppressed equipment", as expressed by Meagher. Any decision in that regard will, of course, depend on respondent's business judgment and not because of any requirement of 29 CFR § 1910.95(b)(1).

As previously discussed, respondent's failure to diligently enforce employee use of personal protective equipment to reduce noise exposure warrants affirmation of the citation.[13/] Under the penalty-assessment criteria of 29 U.S.C. § 666(j),[14/] it is believed that a penalty of $100.00 is appropriate.

## FINDINGS OF FACT

1. At the time the survey of sound levels was made in May 1976, five earthmoving machines, manufactured by Caterpillar Tractor Co., and operated by five employees of respondent during a minimum period of five to six hours per day, generated sound levels ranging from 90 dBA to 95 dBA while "idling", and from 100 dBA to 107 dBA during reverse and forward movements or while moving earth.

---

13/ In its answer to the complaint, respondent presented the argument that the citation does not meet the "particularity" requirement of 29 U.S.C. § 658(a). This contention lacks merit as to the personal protection requirement of the standard in view of the employees specified in the citation who were allegedly not using personal protective equipment. Disposition of the matter makes unnecessary any discussion as to substance of the particularity argument regarding the issue of feasible engineering controls. For a pertinent and informative discussion of the particularity issue, see Secretary v. Gannett Corporation, No. 6352 (May 3, 1976).

14/ Section 17(j) (29 U.S.C. § 666(j)) reads:

> "The Commission shall have authority to assess all civil penalties provided in this section, giving due consideration to the appropriateness of the penalty with respect to the size of the business of the employer being charged, the gravity of the violation, the good faith of the employer, and the history of previous violations."

2. The noise produced by the five machines exceeded permissible sound levels.

3. Although respondent provided its employees personal protective equipment, only one of the five operators was actually using such equipment while the machines were being operated.

4. Respondent did not adequately enforce the use of personal protective equipment by its employees.

5. Engineering controls by means of retrofitting existing cabs with sound suppression material and air conditioner are neither technologically nor economically feasible.

6. Retrofitting respondent's machines by replacing existing cabs with sound-suppressed and air-conditioned cabs is technologically feasible but not economically feasible.

7. The purchase of new earthmoving machines with sound-suppressed and air-conditioned cabs, as a means of reducing sound levels generated by the machines, is technologically feasible but not economically feasible.

8. There is no evidence to establish the feasibility of administrative controls.

## CONCLUSIONS OF LAW

1. At all times relevant herein, respondent has been engaged in a business affecting commerce within the meaning of section 3 of the Act.

2. Respondent violated 29 U.S.C. § 654(a)(2) by failing to comply with the safety standard 29 CFR § 1910.95(b)(1) because its employees did not use personal protective equipment to reduce noise exposure.

3. The charge of noncompliance with 29 CFR § 1910.95(b)(1) based on failure to use feasible engineering or administrative controls is not warranted.

## O R D E R

It is hereby ORDERED that:

1. The agreement to settle the issues involving the three citations of June 11, 1976, and proposed penalties (excepting only item 3 of citation number 1 and the penalty proposed for that item) is approved; respondent's notice of contest to the citations and the proposed assessment of penalties, as amended, is dismissed (except as to said item 3); citations number 1 (excluding said item 3), 2, and 3 are affirmed, and a total penalty of $1,845.00 is assessed therefor.

2. Item 3 of citation number 1, issued on June 11, 1976, involving 29 CFR § 1910.95(b)(1) is affirmed to the extent indicated, the penalty proposed is vacated, and a penalty of $100.00 is assessed in lieu thereof.

## NOTICE OF DECISION

Secretary of Labor v. ROBERT P. LOVELAND, d/b/a SECURITY WELDING
OSHRC Docket No. 82-0136-S

1. Enclosed is a copy of my decision. It will be filed with the Commission on November 18, 1982, and will become the final order of the Commission on December 20, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is December 20, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

James A. Cronin, Jr.
Judge, OSHRC

Date: October 29, 1982

| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>ROBERT P. LOVELAND, d/b/a<br>SECURITY WELDING,<br><br>Respondent. | OSHRC DOCKET NO. 82-0136-S |

ORDER

On May 5, 1982, a Notice of Conference/Hearing was issued scheduling a conference/hearing in the captioned case for June 3, 1982.

On June 2, 1982, the June 3rd hearing was cancelled upon the representation of complainant that a settlement had been reached. The June 2nd order further instructed the parties to file a settlement agreement within twenty days of June 2, 1982.

On August 18, 1982, the parties were ordered to advise within five days when a settlement agreement would be filed.

Subsequently, complainant's counsel advised that respondent had failed to return a settlement agreement which had been submitted by complainant to respondent for his consideration and execution. No response was received from respondent.

On September 1, 1982, a Notice of Hearing was sent to the parties. This notice advised that the hearing would be held in Colorado Springs,

Colorado on October 29, 1982, at 9:00 a.m. The Notice further advised that the parties would be notified at a later date as to the exact location of the hearing.

On October 20, 1982, a notice was sent to the parties that the hearing scheduled for October 29, 1982, would be held at the following location:

New Judicial Building
20 East Vermijo
Colorado Springs, Colorado.

The parties also were instructed to check with Mrs. Florence Bryant, Receptionist New Judicial Building, for exact room designation.

On October 25, 1982, the envelope and notice mailed to respondent on October 20, 1982, was returned to the Denver office of the Commission marked, "Box Closed - No order."

Rule 6 of the Commission Rules of Procedure requires that the initial pleading filed by any person shall contain his name, address, and telephone number, and that any change in such information must be communicated promptly in writing to the Judge or Commission and to all other parties. Rule 6 further provides that a party who fails to furnish such information shall be deemed to have waived his right to notice and service under these rules.

Respondent's failure to comply with Commission Rule 6 is deemed a waiver of his right to further participation in this proceeding and constitutes a default.

Accordingly, it is ORDERED:

1. Citation No. 1, issued January 20, 1982, is AFFIRMED, and a penalty of $80.00 ASSESSED.

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>VANCO CONSTRUCTION COMPANY,<br>Respondent. | OSHRC Docket No. 79-4945 |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

The Secretary of Labor issued a citation item alleging that Vanco Construction, Inc. ("Vanco"), violated 29 C.F.R. § 1926.102(a)(1). The standard requires that employees "be provided with eye and face protection equipment when machines or operations present potential eye or face injury from physical, chemical, or radiation agents." Administrative Law Judge LaVecchia vacated the citation item because he found the evidence of a "potential eye or face injury" insufficient. We reverse the judge and affirm the citation item.

I.

A compliance officer observed two employees without eye or face protection chipping hardened mounds of concrete at a construction site. The employees were using a sledgehammer and a Hilti electric hammer to break down the excess concrete. The operation produced chips and dust particles which the compliance officer observed flying out a distance of four feet. The two workers were continually struck in the face by these particles. The largest chips were approximately the size of a matchhead. The workers were about five feet tall, and crouched as they worked. The compliance officer observed the workers squinting or flinching from the impact of the chips, and occasionally brushing

their faces to remove accumulations of dust and particles. The compliance officer testified that the chips were "definitely" flying out with "great force," and that serious injury would be substantially probable if a chip were to strike an employee in the eye. No form of eye or face protection was available at the worksite.

Douglas Fisher, the area sales manager for the Hilti hammer, testified that he had received no reports of serious eye injuries associated with the use of the hammer in the seven years it had been manufactured (about 200,000 were in use at the time of the hearing). Fisher also stated that the hammer's chisel would absorb about 95 percent of the energy produced by its "striking pistol."

Roy Neel, Vanco's assistant superintendent at the worksite, testified that the sledgehammer was "primarily" used to drive wooden stakes rather than to chip concrete. Neel also claimed that the Hilti hammer did not throw chips into the workers' faces, but only propelled chips about 24 inches. He conceded, however, that he "wasn't observing [the employees] that close."

The senior job superintendent, Ralph Pruett, did not observe the workers at the time of the inspection. He testified that on many previous jobs he observed the Hilti hammer and that it did not spray particles into the face of its operator. He also stated that a sledgehammer striking concrete will produce flying chips.

The judge found that chips of concrete were spraying out from the Hilti hammer up to a distance of four feet, and that the chips would "probably" fly back toward the employees' faces. He also found that the employees were occasionally required to brush the dust and chips from their faces. However, the judge vacated the citation on the ground that the Secretary failed to establish the velocity of the chipped particles and, specifically, because there was no evidence that the chips were travelling fast enough to penetrate the eyes or flesh of the workers. The judge credited Fisher's testimony that no serious eye injuries had been reported in the seven years since the Hilti hammer was first

marketed, and construed his statement about the hammer's design to mean that the velocity of any flying chips would tend to be reduced. The judge did not find a violation with respect to the use of the sledgehammer apparently because there was no evidence as to the velocity at which chips might fly from concrete struck by a sledgehammer. 1/ However, the judge did state that chips flying from a sledgehammer would present more of a hazard, in his opinion, than chips flying from a Hilti hammer.

The Secretary petitioned for discretionary review, and review was directed by former Commissioner Barnako on whether the judge erred in vacating the citation.

On review, the Secretary argues that his burden of proof under the cited standard does not require him to prove the velocity of flying chips and dust particles. He contends that the standard "does not limit the hazard to flying particles of a specified minimum velocity." The Secretary also argues that the standard "recognize[s] that eye contact with flying particles is inherently hazardous regardless of velocity."

Vanco cites the lack of recorded injuries and disputes the Secretary's claim that the electric hammer had enough force to cause injury. The employer claims that the Secretary's position, if adopted, would require the wearing of safety glasses at all construction sites, and that the violation, if any, was de minimis. Vanco also argues that the standard is vague, that it had no knowledge of the violation, that the citation was not issued with reasonable promptness, that the violation at most should be deemed non-serious, and that the penalty is excessive.

II.

We have previously cautioned that "the eye is an especially delicate organ and . . . any foreign material in the eye presents the potential for injury."

---

1/ The judge also stated that there was a conflict in the evidence with respect to the use of the sledgehammer. We disagree with this statement. See discussion below.

Stearns-Roger, Inc., 79 OSAHRC 94/A2, 7 BNA OSHC 1919, 1921, 1979 CCH OSHD ¶ 24,008, p. 29,156 (No. 76-2326, 1979). In Stearns-Roger the Commission held that an employee wearing ordinary eyeglasses and cutting lumber with a portable power saw was engaged in an operation which posed a potential for eye injury under section 1926.102(a)(1). The hazard in that case was flying sawdust and, if the saw blade should shatter or strike a hidden nail, flying metal particles. We did not require the Secretary to prove the velocity of the flying particles as part of his prima facie case.

The facts of this case are no less compelling. Concrete chips were actually propelled with force up to four feet through the air by the hammers. Because the employees were about five feet tall, and crouched as they worked, their faces were within striking distance of the chips. The workers were observed squinting or flinching from the impact of the chips and occasionally were required to brush their faces to remove accumulations of concrete dust. We discount the testimony of assistant superintendent Neel that he did not observe chips striking employees in the face because, as he said, he "probably wasn't observing them that close." We also discount the judge's statement that the evidence as to the use of the sledgehammer is in conflict. No witness at the hearing denied that the sledgehammer was used to chip concrete, and Vanco does not now deny that the sledgehammer was in fact so used.

The judge's finding that any chips thrown through the air would be slow-moving because of the Hilti hammer's design is also not supported by the record. When asked if he knew the striking force of the Hilti hammer, Fisher responded that "there is actually a striking element inside the hammer that is propelled by compressed air, but the chisel or bit would actually absorb ninety-five percent of the energy transmitted from the striking pistol." Fisher's testimony thus concerns the force transmitted within the Hilti hammer's mechanism, rather than the force transmitted by the hammer on impact with the surface being worked.

Even if Fisher had addressed the issue of the force transmitted to the concrete, the fact remains that chips of concrete were flying directly into the workers' faces. 2/

These facts establish a potential for eye injury, given the considerable vulnerability of the eye. The judge's view that the Secretary must prove that the chips were propelled with enough force to penetrate the eye does not comport with the standard's purpose or language and is inconsistent with our precedent. 3/

We also reject Vanco's argument that the standard is vague or that it fails to afford adequate notice to employers. It is well-settled that a standard should not be evaluated for vagueness solely on its face, but should instead be considered on the facts of each case. See Gold Kist, Inc., 79 OSAHRC 93/C8, 7 BNA OSHC 1855, 1859, 1980 CCH OSHD ¶ 24,205, p. 29,445 (No. 76-2049, 1979); accord, Santa Fe Trail Transport Co., 505 F.2d 869 (10th Cir. 1974)(standard must be considered

---

2/ Fisher's additional testimony that he had not received any reports of serious eye injuries attributable to the hammer is of little value. The record does not reflect the conditions under which the hammer is usually operated. It may well be that eye injuries were rare because eye protection is commonly used or because chips are usually not propelled into employees' faces. The record also does not indicate whether Fisher would have received reports of injuries had any occurred.

3/ Vanco refers us to the argument in its post-hearing brief that it lacked knowledge of the violation. This point requires little discussion. The Commission has held that the record must show that the employer knew or with the exercise of reasonable diligence could have known of the violative conditions. Prestressed Systems, Inc., 81 OSAHRC 43/D5, 9 BNA OSHC 1864, 1868, 1981 CCH OSHD ¶ 25,358, p. 31,500 (No. 16147, 1981). Vanco argues that it could not have known that the chipping operation presented a potential for eye injury. Vanco's argument lacks merit. First, the knowledge element of a serious violation refers to the physical conditions that constitute a violation. See Southwestern Acoustics & Specialty, Inc., 77 OSAHRC 25/E7, 5 BNA OSHC 1091, 1092, 1977-78 CCH OSHD ¶ 21,582, p. 25,896 (No. 12174, 1977). That Vanco did not draw the conclusion that there was a potential for eye injury is therefore not the point. Vanco's employees assigned to perform the chipping operation were not provided with eye protection and none was available on the site. It is therefore enough that with reasonable diligence, Vanco could have known that chips were flying into the faces of the employees. See Automatic Sprinkler Corp. of America, 80 OSAHRC 47/E4, 8 BNA OSHC 1385, 1387, 1980 CCH OSHD ¶ 24,495, p. 29,926 (No. 76-5089, 1980).

"in the light of conduct to which it is applied"), citing United States v. National Dairy Corp., 372 U.S. 29, 36 (1963). We stated in Brown & Root, Inc., 81 OSAHRC 44/A2, 9 BNA OSHC 1833, 1840, 1981 CCH OSHD ¶ 25,366, p. 31,563 (No. 76-190, 1981), that:

> [t]he test for determining the vagueness of a standard is the "external and objective test" of whether "a reasonable person responsible for the safety of employees, after considering the standard . . . and the factual situation, would be able to apply the language of the standard to the situation in order to identify the hazard and eliminate it." [Quoting Pratt & Whitney Aircraft, 75 OSAHRC 42/A2, 2 BNA OSHC 1713, 1715, 1974-75 CCH OSHD ¶ 19,443, p. 23,216 (No. 510, 1975).]

The issue is therefore whether a reasonable person could ascertain that the use of the hammers to chip concrete presented a potential for eye or face injury from flying chips and dust. That test has certainly been met. Any reasonable person familiar with the facts would have realized the potential for eye injury. We also note that 29 C.F.R. § 1926.102(a)(5) refers the employer to Table E-1 for use "as a guide in the selection of eye and face protection for the hazards and operations noted." Chipping and flying particles are listed in the table among the operations and hazards for which protection is required. The table, when read in conjunction with section 1926.102(a)(1), thus serves to additionally inform the employer of the appropriate protection for a given operation. See Gold Kist, 7 BNA at 1859, 1980 CCH OSHD at p. 29,443 ("broad terms in standards can acquire meaning when read together with other standards . . ."), quoting Modern Automotive Service, Inc., 74 OSAHRC 9/A11, 1 BNA OSHC 1544, 1973-74 CCH OSHD ¶ 17,369 (No. 1541, 1974); see also Daniel Construction Co., 82 OSAHRC _____, 10 BNA OSHC 1549, 1554, 1982 CCH OSHD ¶ 26,027, p. 32,674 (No. 16265, 1982).

Vanco argues that the citations were not issued with reasonable promptness as required under section 9(a) of the Act, 29 U.S.C. § 658(a). The inspection was conducted on July 25, 1979. The citation was issued 15 days later. In order

to vacate a citation for lack of reasonable promptness, the Commission has held that an employer must establish prejudice in the preparation of its defense. See Stripe-A-Zone, 82 OSAHRC ____, 10 BNA OSHC 1694, 1695, 1982 CCH OSHD ¶ 20,069, p. 32,781 (No. 79-2380, 1982). Although Vanco alleges prejudice in the preparation of its case, it was informed at the closing conference on the day of the inspection that its failure to provide eye protection constituted a safety hazard. In addition there is no showing that the timing of the citation delayed Vanco from immediately conducting its own investigation or that the presentation of its case was hampered due to the alleged delay. See National Industrial Constructors, Inc., 81 OSAHRC 94/A2, 10 BNA OSHC 1081, 1084, 1981 CCH OSHD ¶ 25,743, p. 32,126 (No. 76-4507, 1981). We therefore reject its claim.

III.

The citation alleges that the violation was "serious." The compliance officer testified that if a concrete chip were to strike an employee in the eye, major damage, including the possibility of blindness, could result. Vanco argues on review that "no serious damage could be done even if a chip had struck an employee in the eye . . . ."

In determining the seriousness of a violation, the correct inquiry is not the likelihood of an accident but whether, in the event of an accident, there is substantial probability that it would result in death or serious physical harm. See, e.g., Frank Swidzinski Co., 81 OSAHRC 4/E14, 9 BNA OSHC 1230, 1232-3, 1981 CCH OSHD ¶ 25,129, p. 31,032 (No. 76-4627, 1981). We find that given the delicateness of the eye, serious physical harm would be substantially probable if an employee were struck in the eye by a particle or chip of concrete from one of the hammers. We note that the compliance officer testified that the chips were the size of a matchhead and flew out with sufficient force to cause the employees

to squint or flinch from the impact. We therefore find that the violation is serious under section 17(k) of the Act, 29 U.S.C. § 666(j). 4/

The Secretary proposed that a penalty of $280 be assessed. 5/ As to size, Vanco had over 100 employees. As to good faith, Vanco immediately stopped the chipping and sought to obtain eye protection. The gravity of the violation was moderate. Although only two employees were exposed, particles were indeed flying into the employees faces. As to history of previous violations, we note that although citations had been issued to Vanco, they were not shown to have become final orders. Until a citation becomes a final order, it may not be considered as evidence of a history of previous violations for the purpose of penalty assessment. See General Steel Fabricators, Inc., 77 OSAHRC 173/F2, 5 BNA OSHC 1837, 1838, 1977-78 CCH OSHD ¶ 22,190, p. 26,704 (No. 76-710, 1977). We there-

---

4/ That section provides:

> For the purposes of this section, a serious violation shall be deemed to exist in a place of employment if there is a substantial probability that death or serious physical harm could result from a condition which exists, or from one or more practices, means, methods, operations, or processes which have been adopted or are in use, in such place of employment unless the employer did not, and could not with the exercise of reasonable diligence, know of the presence of the violation.

Vanco argues that the violation at most should be affirmed as de minimis. We disagree. Inasmuch as the failure to provide eye protection could have resulted in severe and permanent injury, the violation was not too trifling to warrant the imposition of an abatement requirement or the assessment of a penalty. See Southwestern Electric Power Co., 80 OSAHRC 81/C7, 8 BNA OSHC 1974, 1975, 1980 CCH OSHD ¶ 24,732, p. 30,445 (Nos. 77-3890 & 77-3391, 1980).

5/ Section 17(j), 29 U.S.C. § 666(i), provides:

> The Commission shall have authority to assess all civil penalties provided in this section, giving due consideration to the appropriateness of the penalty with respect to the size of the business of the employer being charged, the gravity of the violation, the good faith of the employer, and the history of previous violations.

fore do not rely on the fact that there were outstanding citations issued against Vanco. We find a penalty of $280 to be appropriate. 6/

IV

Accordingly, the judge's decision is reversed. The citation item is affirmed; a penalty of $280 is assessed.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: DEC 22 1982

---

6/ Vanco challenges the manner in which the penalty was calculated by OSHA; it argues that because it did not have a history of previous violations, a lower penalty should have been proposed under the guidelines set forth in the OSHA Field Operations Manual. We have previously held that the guidelines provided by the manual do not bind us, do not have the force and effect of law, and do not accord important procedural or substantive rights to individuals. See FMC Corp., 77 OSAHRC 153/D4, 5 BNA OSHC 1707, 1710, 1977-78 CCH OSHD ¶ 22,060, p. 26,573 (No. 13155, 1977). Also, because the Commission assesses penalties de novo, the proposed penalty has no force once it is contested. J.L. Foti Construction Co., 80 OSAHRC 36/C10, 8 BNA OSHC 1281, 1285, 1980 CCH OSHD ¶ 24,421, p. 29,784 (Nos. 76-4429 & 76-5049, 1980).

ROWLAND, Chairman, dissenting:

The standard cited in this case, 29 C.F.R. § 1926.102(a)(1), requires employers performing construction work to provide eye and face protection equipment "when machines or operations present potential eye or face injury from physical, chemical, or radiation agents." Vanco argues that section 1926.102(a)(1) is unenforceable because it does not give fair warning of the conduct it prohibits or requires. Because I am unaware of anything in the standard or its regulatory history that would guide the Commission in its proper application, I would vacate the citation item. I therefore dissent.

The plain meaning of the word "potential" is "possible." 7/ Inasmuch as nearly all construction work poses the possibility of eye injury, a literal reading of the standard would require that eye or face protection be provided in nearly all construction operations. The majority correctly recognizes that this standard could not possibly have been intended to be literally applied. Yet, there is nothing that indicates how it does apply. The standard does not specify which construction operations present a "potential" for eye injury. The other standards in Part 1926 provide the Commission with no guidance to determine the standard's reach. Section 1926.102(a)(5) and Table E-1, which the majority uses as an interpretive aid, are unhelpful. Section 1926.102(a)(5) refers employers to Table E-1 only as a "guide." 8/ Table E-1 does not provide useful information on the requirements of section 1926.102(a)(1) because it does not indicate that eye protection is required in all chipping operations nor does it indicate which chipping operations necessitate eye protection. At best, the table merely guides employers in the selection of eye protection after it is

8/ Daniel Constr. Co., 82 OSAHRC 23/A2, 10 BNA OSHC 1549, 1554 n. 6, 1982 CCH OSHD ¶ 26,027, p. 32,674 n.6 (No. 16265, 1982)(dissenting view).

known that such protection is required. Finally, I am not aware of any regulatory history of section 1926.102(a)(1) that would shed light on its proper application.

It is the duty of the congressionally delegated authority, the Secretary of Labor, to provide ascertainable criteria by which standards can be interpreted and applied. To hold otherwise would mean that the Commission, not the Secretary, is setting the standard, and would conflict with the separation of powers established by Congress under the Act. See Sun Ship, Inc., No. 16118 (December 17, 1982) (dissenting opinion). In the absence of meaningful criteria to guide the interpretation or application of a standard, the Commission's decision is derived, not from the standard, but from the majority's own view of what the standard should say. I recognize, of course, that no standard can be written so as to be entirely free from ambiguity. There are limits to the precision of language. 9/ However, a standard may not be so broadly written that it delegates basic policy matters to the Commission for resolution on an ad hoc and subjective basis.

While I recognize that standards can be construed so as to avoid questions of their validity, 10/ this doctrine applies only where to do so does not overstep the bounds of the judicial function. 11/ For the reasons I have indicated, such a course is not possible in this case. I would therefore affirm the judge's decision and vacate the citation.

DECISION AND ORDER

LaVecchia, J.

STATEMENT OF THE CASE

This is a proceeding under section 10(c) of the Occupational Safety and Health Act of 1970 (29 USC 651 et seq.). Respondent seeks review of a citation issued against it by the Occupational Safety and Health Administration.

Based on an inspection conducted on July 25, 1979 respondent was cited for a serious violation of the safety standard set forth at

29 CFR 1926.102(a)(1), which states that:

> Employees shall be provided with eye and face protection equipment when machines or operations present potential eye or face injury from physical, chemical, or radiation agents.

A hearing was held on December 5, 1979, at Dallas, Texas. The compliance officer conducted a consent inspection of respondent's worksite in Arlington, Texas on the date indicated. He went through the usual preliminary matters with management and then made a walk-around inspection of the site. He observed two of respondent's employees chipping concrete with a "chipper" and a sledgehammer. Chips of concrete were seen flying through the air. (Tr. 17). The men were not using any protection against the flying chips. (Tr. 17). The chipping hammer was in almost constant use, while the sledgehammer was used intermittently. The employee using the sledgehammer was within striking range of the chips flying from the chipping hammer. Neither employee was using any type of face or eye protection from the flying chips. (Tr. 19). The assistant job superintendent, Mr. Neel, told the witness that the two employees were chipping the concrete to form a lower level for the pouring of more concrete. (Tr. 20). The concrete chips flew from 23 to 48 inches after being chipped. The chips ranged in size from tiny specks to larger chips. (Tr. 21). The two employees were short men, and worked in a crouched position. Their eyes and faces would have been much less than 48 inches from the chipping points. (Tr. 22). No protective equipment was available at the worksite. (Tr. 22). The men had been working from four to eight hours on the day of the inspection. (Tr. 24).

The compliance officer was of the opinion that the employees were exposed to dangers to the face and eyes, ranging from minor damage to the skin to many levels of eye injury, including possible blindness. (Tr. 24). The employees were using an electric chipping hammer. (Tr. 27). The employee using the sledgehammer was breaking up larger chunks of concrete. (Tr. 29, 30). (Exs. C-1 through C-4). If the employees had been wearing face shields or eye protection the witness would not have considered respondent to be in violation of the standard. (Tr. 35). Such protective equipment is available on short notice to suppliers. (Tr. 36). Mr. Neel ordered the employees to quit work upon being apprised of the alleged violation by the compliance officer. (Tr. 38). The witness saw the employees' faces being struck by chips while they were working. They flinched when struck. (Tr. 43). The witness did not observe either employee indicating that he had been struck in the eyes by the chips. (Tr. 44). They were under observation about 20 minutes. (Tr. 44). When struck in the face by the flying chips no cuts were sustained. (Tr. 44). The employees ignored the striking chips. (Tr. 44). The chips fly in all directions. (Tr. 49). The employees appeared to be annoyed by the chips, squinting their eyes, and brushing their faces in between work activity. (Tr. 53). Dust particles emanated from the concrete being chipped. These could irritate the employees' eyes, perhaps causing cuts. (Tr. 60). The witness saw the employees brushing the concrete dust from their faces. (Tr. 61). The witness could not interrogate the employees because they were unable to speak English. (Tr. 63).

The area sales manager for the Hilti Fastening Systems, with 12 years in that capacity, testified that the chipping tool used was an electromatic rotary hammer drill, weighing approximately 17 pounds. It is used for drilling concrete for the setting of anchors, and for demolition work, such as the chipping operation here under consideration. The particular model in use at the time of the inspection was a Hilti TE-60 hammer. In excess of 200,000 of these are in use in the United States at the present time, and the model has been produced for the past 7 years. (Tr. 64-65). The witness knew of no reports of serious eye injuries through the use of the Hilti hammer. (Tr. 65). He felt that it would be highly improbable that a chip of concrete would fly into the eye of a workman using the chipper. (Tr. 66). But he did feel that the wearing of safety glasses would add another safety factor. (Tr. 67). There is a striking element inside the hammer that is propelled by compressed air, but the chisel or bit absorbs about 95% of the energy transmitted from the striking pistol. (Tr. 67). He expressed the opinion that more force is exerted by an air hammer than an electric hammer. (Tr. 67). He also asserted that there is more danger of chips flying from an air hammer than an electric hammer, because of the greater impact exerted by the air hammer, and the chips would fly at greater velocity from an air hammer. (Tr. 68).

Roy Neel, assistant superintendent for respondent at the time of the inspection, testified that he was present at the worksite at the time of the compliance officer's visit, and that he accompanied the

inspector on a walk-around tour of the job site. (Tr. 69). Two of respondent's employees were performing concrete chipping operations at that time. (Tr. 69). They were using a Hilti drill and a sledgehammer. The sledgehammer was used primarily to drive stakes into the ground. (Tr. 70). While in the company of the inspector he did not witness any concrete chips or fragments being thrown up into the faces of the employees engaged in the chipping. (Tr. 70). To his knowledge, the Hilti drill does not have enough force to cause chips to fly very far in any direction. (Tr. 70). They would fly perhaps 18 to 24 inches, in his opinion, and would not be traveling with any great force. (Tr. 71). He does not instruct employees under his supervision to wear goggles at all times when working. There are occasions, however, when employees are subject to particles being thrown into their faces by windy conditions.(Tr. 71). The wind was blowing hard at the time of the chipping operation. The employees were engaged in skimming small layers of concrete off a concrete mass, with a view to removing about two inches. (Tr. 71-72). He saw no particles being thrown into the faces of the employees, and did not note any attempts on their part to turn their faces or heads in order to avoid being struck by chips or dust from the concrete. (Tr. 72).

George Parks, safety director for respondent, testified that it has an active safety program. (Tr. 73). He pointed to a favorable workmens compensation experience undergone by respondent, and suggested that its operations were 31 percent better than the average risk. Refunds have been received from the workmens compensation insurance carrier. (Tr. 74).

Ralph Pruett, job superintendent for respondent, testified that Mr. Neel was his assistant on the considered project. He did not observe the employees in the concrete chipping operation. (Tr. 75-76). He is familiar with the type of electric drill (chipper) used by the employees, and has observed chipping operations on many occasions. He stated that he had never seen chips or particles fly into the faces of the men using the chippers. (Tr. 77). He expressed the opinion that the chips do not leave the concrete mass with enough force to go very far. (Tr. 77). He has observed individuals striking concrete with sledgehammers, and has used them himself. Chips of concrete fly from the mass when struck by sledgehammers. (Tr. 78).

## Discussion and Conclusions

On the basis of the evidence before me the citation should be vacated. The critical point of failure in the government's case, it seems to me, is the lack of evidence to show the actual striking force of the flying chips of concrete. There is no evidence to show that the chips are propelled at such force so as to be able to penetrate the eye or the flesh of employees using the electric chippers or employees within range of the flying chips. Although not conclusive on the point, it is significant that the manufacturer's representative stated that more than 200,000 of these tools had been in use throughout the country for the past seven years, with no serious eye injuries reported. The chisel or bit of the tool absorbs about 95 percent of the energy transmitted from the striking pistol. This would obviously reduce the speed at which chips

would be thrown through the air. Chips flying from the chipper travel 18 to 48 inches, if credence is given to all of the testimony. That being the case, it does not appear likely that the velocity of the chips would be much after the first 18 inches. It would also appear that the chips would fly primarily away from the employee using the chipper, although in some instances they would probably fly back toward the face of the employee. Employees were seen wiping the chips, or concrete dust from their faces, but this would appear to be more of a nuisance than a hazard covered by the standard. Chips flying from a sledgehammer would present more of a hazard, in my opinion, than chips from a chipper. The evidence is in conflict with respect to the use of the sledgehammer. The compliance officer stated that he saw the sledgehammer being used to chip concrete, whereas company officials stated that sledgehammers are used primarily for driving stakes into the ground, and secondarily for chipping concrete. The record does not suggest the velocity at which the chips might fly from concrete struck by sledgehammers.

I conclude that the evidence fails to show a violation of the cited safety standard.

ORDER

Based on the foregoing, it is ORDERED that:

Citation No. 1 is VACATED.

|---|---|
| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>DEERING-MILLIKEN, INC.<br>Respondent. | OSHRC Docket Nos. 12598 & 13037 |

ORDER OF REMAND

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

On December 17, 1982, the Commission issued its decision in Sun Ship, Inc., OSHRC Docket No. 16118. In accordance with the decision of the U.S. Supreme Court in American Textile Manufacturers Institute, Inc. v. Donovan, 101 S.Ct. 2478 (1981) ("ATMI"), the Commission held that "feasible" under the occupational noise standard means achievable. The Commission overruled the cost-benefit test of feasibility previously set forth in Continental Can Co., 76 OSAHRC 109/A2, 4 BNA OSHC 1541, 1976-77 CCH OSHD ¶ 21,009 (No. 3973, 1976), appeal withdrawn, No. 76-3229 (9th Cir. Apr. 26, 1977), and substituted a test consistent with ATMI.

In view of this intervening change in law, the judge's decision with respect to the alleged violations of section 1910.95(b)(1) is vacated. The case is remanded for further proceedings, including evidentiary submissions, so that the interrelated issues of technological and economic feasibility can be reconsidered in light of the test of feasibility established by Sun Ship, Inc.[1/]

SO ORDERED

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: DEC 23 1982

---

1/ Chairman Rowland dissents. He would not remand the case for further proceedings. Consistent with his dissenting opinion in Sun Ship, he concludes that the requirement in section 1910.95(b)(1) that feasible administrative or engineering controls be utilized is invalid.

on behalf of the respondent

BRADY, Judge: This is a consolidated proceeding brought pursuant to section 10 of the Occupational Safety and Health Act of 1970, 29 U.S.C. 651 et seq. (hereinafter referred to as the Act) to contest two citations issued by the Secretary of Labor (hereinafter referred to as the Secretary) pursuant to section

9(a). The citations which were issued April 14, 1975 and April 28, 1975, respectively, alleged that as the result of certain inspections at two of the respondent's workplaces, it violated section 5(a)(2) of the Act by failing to comply specific Occupational Safety and Health standards promulgated by the Secretary pursuant to section 6 thereof. A notice of proposed penalty was issued with one citation.

The Secretary alleges that on February 24, 1975 respondent, a textile manufacturer, violated four Occupational Safety and Health standards at its Kex plant located in LaGrange, Georgia. It is also alleged that on April 3, 1975, the respondent violated five Occupational Safety and Health standards at its New Holland Plant located in Gainesville, Georgia.

The only matter remaining in issue at the time of the hearing as a result of various stipulations was whether respondent violated the standard at 29 C.F.R. § 1910.95 at both work sites. The standard provides as follows:

29 C.F.R. §1910.95 Occupational Noise Exposure

> "(b)(1) When employees are subject to sound exceeding those listed in Table G-16, Feasible Administrative or engineering controls shall be utilized. If such controls fails to reduce sound levels within the levels of Table G-16, personal protective equipment shall be provided and used to produce sound levels within the levels of the Table."

TABLE G-16 Permissible Noise Exposures

| Duration per day, hours | Sound level dBA slow response |
|---|---|
| 8 | 90 |
| 6 | 92 |
| 4 | 95 |
| 3 | 97 |
| 2 | 100 |
| 1-1/2 | 102 |
| 1 | 105 |
| 1/2 | 110 |
| 1/4 or less | 115 |

It was stipulated that the noise levels in the weave rooms involved remained constant during a work shift (Joint Exhibit 1). Also, it is uncontroverted that weavers and other employees were subject to sound levels in excess of the permissible limits provided in Table G-16. The sound levels in the weave room of the Kex Plant ranged from 94.5 dBA to 97 dBA (Tr. 32, Exh. C-1). In the weave room of the New Holland Plant the sound levels ranged from 103 to 105 dBA (Tr. 63, 66).

Respondent first contends that as a matter of proof complainant has the burden to prove there were feasible controls which would have reduced the noise levels to within the limits prescribed in Table G-16, and not just reduce the noise levels.

This contention is without merit as the standard clearly sets forth that if the limits of Table G-16 are not met "feasible engineering or administrative controls shall be utilized", without any exception. The standard does not state

that such controls are to be utilized only if they reduce the noise levels to within the limits set forth in Table G-16. The burden imposed upon the complainant by this part of the standard is to establish that there are feasible administrative or engineering controls which will reduce the decibel (dBA) level and that such controls were available at the time of the inspections.

The central issue, therefore, is whether the complainant has shown by the evidence of record that there are feasible controls which could reduce the decibel level. 1/

The Secretary relied on the testimony of Dr. Robert Crawford to meet his burden of proof as required by the standard. Dr. Crawford has a Ph.D. from the Institute of Noise and Vibration at the University of Southampton in England. His doctoral dissertation dealt with noise reduction in various textile machines and was entitled, "Textile Machine Noise." At the time of his graduation, this was the only institute in the western world offering a Ph.D. in noise and vibration engineering. Since his graduation he has performed consulting services in noise reduction for numerous industries including the design and manufacture of replacement parts for the purposes of reducing noise levels. Dr. Crawford has also been called upon to deal with the reduction of noise associated with looms in weave rooms (Tr. 105-109, Exh. C-13).

---

1/ As used herein, the term "feasible" means that which is "practicable or useful under the circumstances", as defined by Commissioner Cleary in Secretary v. Anchor Hocking Corp., 19 OSAHRC 308 (1975).

## SUMMARY OF EVIDENCE

### KEX PLANT

Mr. Charles Burnham, Vice President of Engineering for Rockwell International's Draper Division, manufacturer of the Draper shuttleless loom (DSL), explained briefly the operational aspects of the loom which was in operation in respondent's Kex Plant. He explained the shuttleless weaving process of the loom and pointed out that the DSL has two filling carriers mounted on flexible steel tapes which advance across the loom through the shed of warp yarn from both sides of the loom, feed in the middle, transfer the strand of filling yarn from the right carrier to the left, and return to the sides of the loom. The steel tapes wind and unwind from reciprocating tape wheels to which they are bolted. The power from the tape motion is supplied from the drive mechanism through its motor pinion gear to the transmitter drive gear (Tr. 97-101, Exhibits C-3, C-6).

Dr. Crawford, qualifying as an expert in the identification and evaluation of noise sources, and engineering control of noise specifically referenced to industrial facilities, testified that he visited the Kex Plant on August 18, 1975. He determined that the noise sources in the weave room were associated with the Draper shuttleless looms. The noise specifically radiates from the tape covers, the yard guard shields, the heddles and frames, and from the drive mechanism ( Tr. 118-119).

Dr. Crawford explained that the types of sound in the plant consist of direct sounds from the machines, and the reverberant sound field. The sound from the machines is direct to the operator while the reverberant sound field is caused by the multiple reflections of noise from various surfaces such as ceilings, walls, and other objects. The sound field as heard by the operator is a combination of the direct sound field from the machines, plus reverberant sound field from within the area. He stated that the noise levels in the weave room could be reduced by certain modifications to the looms and through the use of sound absorptive room surface treatment (Tr. 124-126).

Dr. Crawford further explained that through the loom modifications in the Kex Plant, the reduction at the weaver's alley could be 3 to 5 decibels. The modifications in combination with absorptive ceiling treatment could result in a total reduction of 6 to 8 decibels (Tr. 239).

Dr. Crawford stated that the loom modifications could be divided into two classes. The first would involve dealing with the noise at each source and secondly the enclosure of two ends of the loom (Tr. 127).

He recommended use of Aquaplas, which is a trade name for a viscoelastic damping compound that could be painted on the surface of the tape wheel covers with a brush to reduce the

vibration levels and thus the amount of radiated noise from the covers. The noise being generated within the tape wheel cover can also be reduced by sound absorption material. In addition, vibration in the cover could be controlled with the use of rubber grommets or washers (Tr. 127-128, 155-156).

Dr. Crawford pointed out that the problem associated with the yard guards is due to the large surfaces in comparison to the general structure of the machine which therefore, vibrates causing a radiation of noise. Again, the application of a damping compound would reduce the vibration levels and thus reduce the radiated noise. The application of sound absorptive material on the other side of the covers could prevent reflections from the yard shield itself (Tr. 129). The foregoing enclosures of the ends of the loom would be provided with proper access for maintenance (Tr. 133). Such enclosures were observed on a Draper loom at an exhibition which was of the same basic design as the DSL (Tr. 185).

The third noise source associated with the DSL involves the heddles including frames. The frames are those devices which shed the warp threads and move up and down after each pass of the shuttle. The heddles are metal eyelets attached to frames through which the warp threads pass. They are small in size and are made of hard material which tends to radiate high frequency noise as opposed to low frequency noise when the movement takes place in the frames (Tr. 129-130).

Dr. Crawford's view was that the heddles should be replaced with quiet heddles of a type which is commercially available from Egelhaaf, a German firm. He explained that they are presently made of a sandwich material on the frames consisting of a combination of metal, plastic material and metal (Tr. 160). A change to the sandwich heddles would result in a 2.5 decibel reduction (Tr. 169). He indicated that he had not run any test of his own with reference to the heddles as well as the tape wheel cover and the arm-filling shield guards (Tr. 161).

The noise produced by the drive train is the result of metal to metal contact with the operating gear. The metal pinion should be replaced with an engineered plastic gear (Tr. 161). Dr. Crawford was aware that Draper Division of North American Rockwell Company attempted use of a plastic gear to no avail and although he did not know the details of the testing by the company he believed forged nylon material would be suitable as he has seen such gears used in other wood looms (Tr. 163). He estimated a noise reduction of 3 to 4 decibels as the result of the pinion gear replacement (Tr. 169).

It is Dr. Crawford's view that all four controls should be implemented as each contributes to the overall noise level

of the machine. He therefore believed the noise reduction to the operator would be on the order of 3 to 5 decibels. Enclosure of the tape wheel covers alone would conservatively amount to a 5 decibel reduction. In combination with the sound absorptive treatment, the reduction would be approximately 6 to 8 decibels and with implementation of all the recommended controls the reduction would be 8 to 10 decibels (Tr. 131-135).

The respondent presented testimony by Mr. Charles Burnham to refute the feasibility of reducing the noise levels associated with the DSL modifications. Mr. Burnham qualified as an expert on noise control for the testile industry both in DSL and fly shuttle (X-3) weaving based on his 30-year career with Draper (Tr. 413). He testified that by the use of noise testing equipment the primary noise source of the DSL was the mesh point between the motor pinion gear and the transmitter drive gear. The next significant noise source was from the harness motion of the harness frames.

The third significant source is the tape motion involving the tape and tape wheel gear.

Mr. Burnham testified that the manufacturer experimented with a DSL retro-fit kit designed to reduce DSL noise by 7.5 decibels, which included a plastic motor pinion gear. He indicated that upon testing the retro-fit kit including the plastic motor pinion gear, they were rejected and never placed on the market (Tr. 422-426). Mr. Burnham acknowledged that a

portion of the DSL's sound power radiated from the filling shield and agreed that a dampening material placed on the yarn shield covers would reduce the radiated sound. Also, he agreed that loom modifications with available hardware could achieve a 2 decibel reduction and if the drive noise could be successfully suppressed, an additional reduction of 5 to 5 1/2 decibels could be realized.

Mr. George Ridenhour, Manager of respondent's Service Corporation's Machine Maintenance Department, testified that he was responsible for Deering Milliken's textile machinery maintenance (Tr. 276-277). He explained that in May 1975 nylon motor pinion gears were tried on the DSL's at the Kex Plant but the tests were discontinued when the gears failed under physical strain (Tr. 303-304).

Respondent next attacks the replacement of the metal heddles with quiet heddles which Dr. Crawford had indicated were available at the Engelhaaf Company. Mr. L. K. Fitzgerald, retired Vice President of Deering Millikin Corporation, testified that he had never heard of "quiet or sandwich" heddles (Tr. 395). He also learned that Engelhaaf was not presently marketing such heddles and did not know of such a type (Tr. 398, Exhibit R-14).

It is not disputed that the noise from the tape wheel covers and filling shield guards could be reduced a minimal amount with the application of dampening material. It is argued, however, that reduction of DSL noise by 3 to 5 decibels can not feasibly be accomplished.

Also, it is argued that Dr. Crawford has not seen the type of loom enclosures that he recommends, and his recommendations for the DSL's were made without the performance of any tests.

Mr. Burnham pointed out that the loom enclosures observed on the Draper Apollo loom in Milan, Italy, was a prototype with enclosures primarily for appearance and styling with a secondary purpose for sound reduction (Tr. 495). He stated that enclosures were not commercially available (Tr. 437).

## NEW HOLLAND PLANT

Dr. Crawford testified with reference to his inspection of the Draper X-3 fly shuttle looms at the New Holland Plant on January 20, 1976. He stated that noise sources in the weave room were associated with impacts of the various parts of the loom. In his opinion the noise levels in the New Holland Plant weave room could be reduced by the same independent methods recommended for the Kex Plant (Tr. 140). This would include the installation of sound absorption material in the ceiling with a sound absorptive co-efficient in the range of .8 to .95 operative over a frequency range of 500 Hertz to 4 kilohertz (4,000 Hertz) which could reduce the noise 3 to 5 decibels (Tr. 140-142).

The implementation of loom modifications in addition to the acoustical treatment would achieve a reduction of about 5 to 8 decibels (Tr. 145).

Mr. Burnham explained the operation of the X-3 fly shuttle loom which consists of a shuttle containing a supply of filling which is propelled back and forth through the warp shed. Each passage of the shuttle is a "pick" which causes numerous impacts (Tr. 88-94).

Dr. Crawford determined that one source of noise was the impact of the picker stick on the side loom check (Tr. 136-137). This condition could be corrected with use of a more resilient material than the hard leather check. Polyurethane or rubber impregnated felt coult be used as well as installation of a pneumatic air spring damper system. Polyurethane picker sticks were indicated as being commercially available through the British Picker Company (Tr. 224). The dampening device could be inserted between the picker stick and the frame of the loom to slow the picker stick, thereby reducing the impact on the picker stick bumper (Tr. 142-143).

The impact of the picker on the shuttle was another noise source. This could be controlled by replacing the existing hard fiber picker with a polyurethane picker including a polyurethane insert. The insert would take the brunt of the impact.

There is also a source of noise from the impact of the shuttle on the shuttle arresting mechanism as it enters the box on the binders. The hard leather side checks could be replaced on the binders and box plate with hard polyurethane

liners which would reduce the force of the impact (Tr. 143-144).

The picker stick also impacts on the lug strap which is a source of noise. This could be corrected by reducing the amount of play between the lug strap and the picker stick, and also replacing the metal power block with a polyurethane power block (Tr. 144).

Another source of noise is the impact of the cam on the pick ball. The noise from this could be reduced by replacing the metal pick ball with plastic or polyuethylene to eliminate the metal to metal impact (Tr. 144).

Dr. Crawford also found noise eminating from the frames and heddles and the gear drive mechanism (Tr. 136-140). The noise from the heddles and frames should be controlled in the same manner as the DSL loom by replacing the heddles with quiet heddles as previously described. Also, noise from the gear drive mechanism could be reduced by eliminating the metal to metal contact and replacing the motor pinion with an engineered plastic gear. This noise was of a continuous nature with fluctuations and not an impact source (Tr. 144-145).

In Mr. Burnham's opinion the number of picks per minute would have to be reduced in order for plastic motor pinions to succeed as recommended by Dr. Crawford (Tr. 442).

He also pointed out that a pick ball of a resilient plastic material was not commercially available. Mr. Burnham also testified that Draper's experience with plastic pick balls prior to April 1975 had shown "a very rapid failure of the pick ball . . . by shelling out the surface or scalloping of the surface" when in contact with the metal pick cam toe (Tr. 439). Dr. Crawford deemed the noise source controllable by replacing the hard resin fiber picker with a polyethylene picker with polyurethane insert. Respondent indicates that at the time of the inspection Dayco rubber impregnated pickers were being used in the New Holland plant and not hard resin bonded fiber pickers (Tr. 306). It is conceded, however, that there would be an improvement in the sound level if polyurethane pickers were used (Tr. 438-439).

In response to Dr. Crawford's proposal to reduce noise from the picker stick impacting on the bumper, respondent showed that Draper's experience with softer picker stick bumpers such as leather covered foam resulted in failure within a week at the most. Also, use of pneumatic dash pots resulted in increased noise levels (Tr. 437, 438).

The other recommendation by Dr. Crawford was replacement of the hard leather binders with polyurethane. It was shown that pre-1975 experiments by Draper with hard polyurethane binders resulted in melting at the point of contact with the incoming shuttle (Tr. 439).

In spite of the respondent's attack on the techniques advanced by Dr. Crawford, modification of the X-3 looms to reduce the noise level by 3 decibels was a prevailing view of the parties as Mr. Burnham agreed that there was hardwear available which could reduce the noise levels produced by the X-3 looms by 3 decibels in the weave room of the New Holland Plant (Tr. 442).

## Sound Absorptive Room Surface Treatment

Dr. Crawford described the weave room at the Kex Plant as a large main area and a smaller adjacent area known as the kitchen (Tr. 125; Joint Exhibit 2). In the large area Dr. Crawford stated that the reverberant noise could be reduced 3 to 4 decibels at the operator's station in the weaver's alley upon installation of an acoustical ceiling made up of .95 over the range of 500 to 4,000 hertz, hung from the ceiling in a rectangular array resembling a honeycomb (Tr. 125, 201, 245, 462-464; Exhibit C-14). The batts would be mineral wool encased in polythene (Tr. 192, 466). The

smaller kitchen area would have the walls treated in addition to the aforementioned ceiling treatment in order to achieve the 3 to 4 decibel reduction (Tr. 125).

Dr. Crawford believed that if the acoustical room surface treatment was used in conjunction with loom modifications to the sources of noise on the DSL's a noise reduction of 6 to 8 decibels could be achieved at the operator's atation in the weaver's alley (Tr. 133, 239). The use of acoustical room surface treatment in conjunction with an acoustical enclosure of the noise sources on the ends of the DSL's would achieve a noise reduction of 8 to 10 decibels at the weaver's station. These recommended controls were available as of February 24, 1975 (Tr. 134, 240).

Dr. Crawford recommended the same type absorptive room surface treatment for the ceiling in the weave room at the New Holland Plant as proposed for the Kex Plant (Tr. 216). This would result in the reduction of reverberant sound created by the wood and concrete floors, brick walls and wood ceiling by 3 to 5 decibels at the operator's station (Tr. 141, 142, 240).

If the sound absorptive room surface treatment was utilized in conjunction with the loom modifications to the X-3 looms, a noise reduction of 5 to 8 decibels would be achieved at the operator's station (Tr. 145).

Respondent rejects the proposed recommendations for reducing the reverberant sound in the weave rooms of both plants with the use of sound absorptive material. Also, the initial reference to "ceiling treatment" by complainant's acoustical expert, and his subsequent recommendation of "acoustical batts" is objectionable to respondent. It must necessarily be held, however, that use of sound absorptive surface room treatment as described by Dr. Crawford includes, interchangeably, installation of an acoustical ceiling and overhead acoustical batts.

Respondent offered testimony to refute the feasibility of acoustical treatment to the ceilings of the weave rooms. The testimony dealt with the problems that would be encountered with making modifications to the overhead sprinkler system, air-conditioning ducts, crane rail, electrical and atomizer systems (Tr. 314-325).

Dr. Crawford believed these problems could be remedied by decreasing the size of the batts in various areas from 2 feet vertically by 4 feet horizontally to 1 foot vertically by 2 feet horizontally and proper spacing of the batts (Tr. 464, 494). The batts could be reduced in size without losing any effectiveness provided the total surface area of acoustic treatment is maintained by increasing the number of panels. Therefore, if the batts were reduced in size by one-half, the number of

panels would have to be doubled, thus the bottom side of the batts would be one foot above the ducts, sprinklers, etc. (Tr. 330, 345, 356, 392, 465).

## DISCUSSION

It is established without dispute in this case that respondent's employees were exposed to noise levels for a period in excess of those permitted by the standard. Upon full consideration of the record, it must be held that complainant has established a violation of the standard as alleged.

The Secretary, through an eminently qualified expert, clearly identified sources of noise from the looms and recommended specific engineering controls for its reduction. Two independent methods of engineering controls were proposed consisting of sound absorptive room surface treatment and loom modifications.

The sources of noise were determined by the parties to be essentially the same. However, respondent rejects the various modifications of the looms recommended by Dr. Crawford primarily on the basis that the manufacturer did not have commercially available engineering controls for them.

Respondent's expert witness did admit that there is hardware available which could reduce the decibel level in the Kex Plant by 2 decibels and that if a plastic motor pinion gear could be developed, a reduction of another 5 to 5 1/2 decibels could be achieved. Although respondent showed that

nylon pinion gears were tried on the DSL's without success, Dr. Crawford has seen engineered plastic gears in operation and maintained such gears could be successfully utilized on the DSL.

Complainant's expert testified that certain loom modifications to the X-3 looms could result in a 3 to 4 decibel reduction.

Respondent's witnesses testified against the techniques advanced by Dr. Crawford but it's expert witness, Mr. Burnham, admitted that there was hardware available which could reduce the noise level produced by the X-3 fly shuttle loom by 3 decibels in the weave room of the New Holland Plant. The witness also explained the significance of a 3 decibel reduction in that it represented a substantial reduction in sound power.

The 3 to 4 decibel reduction through acoustical room surface treatment at the Kex Plant was not refuted by respondent. Also, the 3 to 5 decibel reduction at the New Holland Plant was likewise unchallenged.

The issue, as viewed by the respondent, is not whether the evidence establishes that acoustical batts can reduce reverberant sound levels in a hard surface room, but whether there is evidence in the record to establish to perponderance that it would be feasible to install acoustical batts in the weave rooms of the plants involved.

The testimony on behalf of respondent therefore dealt with the problems associated with installation of acoustical batts in the facilities involved. It was acknowledged that such problems are of an engineering nature and that various modifications to air conditioning systems, electrical systems, crane rails, etc., are ordinarily required when the type facilities herein are purchased.

The evidence of record shows that the application of sound absorptive material is a method of reducing sound levels. The recommendations of Dr. Crawford for room surface treatment and the manner of installation outlined sufficiently establishes a feasible engineering control which was available to respondent. Respondent apparently recognizes the beneficial results of room surface treatment as acoustical ceilings are installed in its new plants. However, no attempt has been made to implement acoustical ceiling treatment in the Kex or New Holland Plants.

The record is clear that at the time of the inspection respondent was engaged in no efforts to develop and apply techniques to control sound in either of the weave rooms despite the fact that evidence offered by both parties shows that such techniques were known, and application thereof would result in significant reduction of noise levels to employees. Furthermore, respondent raised no objection to the possible cost of the Draper retro-fit kit which incorporated

certain loom modifications. Likewise, installation of acoustical ceilings in new plants has not been shown to be economically infeasible, and costs have been incurred for other purposes when older plants have been purchased.

The Act places the primary responsibility for the safety and health of employees upon employers. This responsibility includes an affirmative duty to take all steps possible to protect employees from hazards in the workplace. While the respondent asserts that personal protective equipment was being used in the weave rooms, such equipment according to the standard, is to be used only during the period when engineering or administrative controls, which have been implemented, can not by themselves produce sound levels to within the sound levels of Table G-16. Accordingly, the standard requires a duty to develop and implement engineering controls after a showing that such measures are technologically feasible. The standard does not provide or allow for the employer to limit his responsibility to implement various controls already fully developed.

It is, therefore, incumbent upon the respondent to provide an ongoing noise control program that will reduce sound levels to meet the requirements of the plain wording of the standard. Therefore, it is held respondent violated the standard at the Kex and New Holland Plants as alleged.

## FINDINGS OF FACT

1. Deering Milliken, Inc., is a corporation having a place of business and doing business, among other places, at Spring Street, Gainesville, Georgia, and Leeman Street, LaGrange, Georgia.

2. On February 24, 1975 and April 3, 1975 respondent was engaged in the business of textile manufacturing.

3. On February 24, 1975 and April 3, 1975, authorized representatives of the Secretary conducted inspections of respondent's aforementioned worksites. As a result of such inspections, on February 28, 1975 and on April 14, 1975 citations were issued respondent alleging violation of the standard at 29 C.F.R. 1910.95.

4. At the time of the inspections respondent's employees were exposed to noise which exceeded the sound levels set forth in Table G-16 of the standard.

5. The Secretary established two methods of feasible engineering controls to reduce the noise in the Kex and New Holland Plants.

6. Respondent failed to utilize feasible engineering controls to reduce the aforementioned sound levels.

## CONCLUSIONS OF LAW

1. Deering Milliken, Inc., at all times pertinent hereto, was an employer engaged in a business affecting commerce within the meaning of section 3(5) of the Occupational Safety and Health Act of 1970, and the Commission has jurisdiction of the parties and subject matter herein, pursuant to section 10(c) of the Act.

2. Respondent is, and at all times pertinent hereto, required to comply with safety and health regulations promulgated by the Secretary pursuant to section 6(a) of the Act.

3. Respondent was in violation of the standard at 29 C.F.R. 1910.95 on February 24, 1975 and April 3, 1975 as charged in the citations.

Upon the basis of the foregoing findings of fact and conclusions of law, and the entire record, it is

ORDERED

That the citations issued February 28, 1975 and April 14, 1975 charging violation of the standard at 29 C.F.R. 1910.95 are hereby affirmed.

Dated this 27th day of May 1977.

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>PABST BREWING COMPANY,<br>Respondent. | OSHRC Docket No. 13068 |

ORDER OF REMAND

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

On December 17, 1982, the Commission issued its decision in Sun Ship, Inc., OSHRC Docket No. 16118. In accordance with the decision of the U.S. Supreme Court in American Textile Manufacturing Institute, Inc. v. Donovan, 101 S.Ct. 2478 (1981) ("ATMI"), the Commission held that "feasible" under the occupational noise standard means achievable. The Commission overruled the cost-benefit test of feasibility previously set forth in Continental Can Co., 76 OSAHRC 109/A2, 4 BNA OSHC 1541, 1976-77 CCH OSHD ¶ 21,009 (No. 3973, 1976), appeal withdrawn, No. 76-3229 (9th Cir. Apr. 26, 1977), and substituted a test consistent with ATMI.

In view of this intervening change in law, the judge's decision with respect to the alleged violation of section 1910.95(b)(1) is vacated. The case is remanded for further proceedings, including evidentiary submissions, so that the interrelated issues of technological and economic feasibility can be reconsidered in light of the test of feasibility established by Sun Ship, Inc.[1/]

SO ORDERED

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: DEC 23 1982

---

1/ Chairman Rowland dissents. He would not remand the case for further proceedings. Consistent with his dissenting opinion in Sun Ship, he concludes that the requirement in section 1910.95(b)(1) that feasible administrative or engineering controls be utilized is invalid.

## DECISION AND ORDER ON REMAND

APPEARANCES:

Stephen J. Simko, Jr., Esquire, Office of the Solicitor, U. S. Department of Labor, Atlanta, Georgia, on behalf of complainant.

Mr. J. D. Fleming, Jr., Esquire, Sutherland, Asbill and Brennan, Atlanta, Georgia, on behalf of respondent.

## STATEMENT OF CASE

LARKIN, JUDGE

This case is on remand from the Occupational Safety and Health Review Commission (Commission). Respondent (Pabst) operates a brewery at Perry, Georgia. On April 7, 1975, Pabst was cited[1/] for a non-serious

---

1/ The citation described the violation of 29 C.F.R. § 1910.95(b)(1) as follows:

> "Failure to use feasible engineering or administrative controls to protect employees from exposure to hazardous noise levels exceeding those specified in 1910.95 Table G-16. Violations occurred in the Filling Room # III - West, Filling Room No. III, East, No. 2 Filling Room, No. 1 Filling Room, Machine Operators in Can Packaging Area, Uncaser and Rinser Operator, Label Machine Operators, H & K Packer Machine Operator, SK Glue Machine Operator, 3 West Uncaser & Rinser Operator and Bottle Pasteurizer Operator.
>
> "Long Range Abatement: April 9, 1976
>
> "An Abatement Plan shall be submitted by: July 5, 1975"

violation of section 5(a)(2) of the Occupational Safety and Health Act of 1970 (Act) for failure to conform with 29 C.F.R. § 1910.95(b)(1).[2/]

The areas left in issue are Filling Rooms I, 2, III East and III West.

In Filling Room I, cans are filled with beer in two 100-spout fillers, operating at a rate of approximately 90,000 cans per hour each, for a total filling rate of approxiately 180,000 cans per hour. Two employees operate these fillers. In Filling Room 2, cans are filled with beer in two 88-spout fillers, each of which processes approximately 72,000 cans per hour, for a total filling rate of approximately 144,000 cans per hour. Two employees operate these fillers. After being filled, the cans from Filling Rooms I and 2 move to a pasteurizer outside of the filling rooms. Twelve-ounce non-returnable bottles pass from a bottle sterilizer into Filling Room III East, where they are filled in a 72-spout filler at a rate of approximately 42,000

---

2/ The standard at 29 C.F.R. § 1910.95(b)(1) provides:

> "When employees are subjected to sound exceeding those listed in Table G-16, feasible administrative or engineering controls shall be utilized. If such controls fail to reduce sound levels within the levels of Table G-16, personal protective equipment shall be provided and used to reduce sound levels within the levels of the table.

Table G-16—Permissible Noise Exposure

| Duration per day, hours | Sound level dBA slow response |
|---|---|
| 8 | 90 |
| 6 | 92 |
| 4 | 95 |
| 3 | 97 |
| 2 | 100 |
| 1-1/2 | 102 |
| 1 | 105 |
| 1/2 | 110 |
| 1/4 | 115" |

bottles per hour. One employee operates this filler. Returnable and non-returnable bottles, primarily 12-ounce returnable bottles, pass from the bottle sterilizer into Filling Room III West, where they are filled in a 100-spout filler at a rate of approximately 36,000 bottles per hour. Two employees, one to operate the filler and one to operate a soaker-discharger, work in Filling Room III West. After being filled, bottles pass from Filling Rooms III East and III West into a pasteurizer.

Filling Rooms I and 2 are approximately 40 feet by 70 feet. Filling Rooms III East and III West are approximately 40 feet by 60 feet. The rooms have concrete block walls with plaster ceilings.

The Packaging Center normally operates on three daily eight-hour shifts. All of the fillers are operated about 70% of the time during the day shift. As few as two fillers may be operated on a shift and it is rare that all of the fillers are run except on the day shift. The operators normally spend between 6.5 and seven hours per shift in the filling rooms. Other personnel come into the filling rooms, including maintenance, utility, clean-up, and supervisors but their exposure time is not in issue.

In Filling Rooms III East and III West, the operators monitor the filling operation. They correct bottle jams and feed crowns at the crowner chute. The operators move along a platform 12 to 14 feet long. If problems occur they spend 70% to 80% of their time at the crowner, two to four feet away from the filler. Otherwise, they spend approximately 50% of their time at the crowner.

In Filling Rooms I and 2, the operators feed lids to the canning machine and monitor along an 18-foot platform. Approximately 60% of the

time is spent feeding lids to the seamer and 40% is spent at other locations. The operators feel the cans to detect indentations and remove foreign material in the seamer causing the problem. The operator must clear jams, sometime to the extent of using crowbars. The can lines run approximately 70% to 75% of the time.

The noise measurements on March 12, 1975, and June 23, 1977, in the four filling rooms were as follows:

**Room III West**

| Noise Levels | Location |
|---|---|
| 98 - 105 | platform |
| 98 | platform - cap machine |
| 102 | platform - filler area |
| 98 - 101 | platform - soaker discharge |
| 98 - 100 | floor - between conveyor and soaker discharge |

**Room III East**

| | |
|---|---|
| 103 | platform - filler |
| 98 - 102 | platform |
| 101.5 | platform - machine running and not filling |

**Room 2**

| | |
|---|---|
| 91 - 92 | platform - machine running and not filling |
| 97 - 98 | platform - machine filling |

| | |
|---|---|
| 97.5 | east machine - cap filling location |
| 97 - 98 | filler area |
| 97 | between filling machines |
| 98 | behind machine |

Room I

| | |
|---|---|
| 102 - 103 | west machine - filling platform |
| 102 | between machines |
| 101 - 103 | east machine - platform |
| 101 | east doorway |
| 102 | conveyor line - between machines |

In areas of possible excessive noise, signs requiring hearing protection are posted and Pabst employees are required to use personal hearing protectors.

The workers in Filling Rooms I, 2, III East and III West wear muffs. These muffs will lower noise at the eardrum by at least 30 dBA or to a level between 68 and 72 dBA.

On June 23 and 24, 1977, Dr. Thomas H. Melling, Hampshire, England, agreed upon by the parties as an expert in acoustical engineering and noise control in breweries, inspected Pabst's facility to determine the feasibility of engineering controls to reduce the noise levels. Dr. Melling's report was received into evidence by agreement of the parties.

Two components make up the noise level in a room with machinery running. The first is the direct noise from the machines. The second is the reverberant level produced by all of the noise sources in the room. The

direct noise level at the operator's ear decreases as he moves away from the machine. If the machine is compact, such as a motor or a pump, the direct noise level decreases by approximately six dBA with each doubling of the distance from the center of the machine. For example, if the direct noise level is 102 dBA when the operator is two feet from a pump, it falls to 96 dBA when he moves to four feet from the pump. If the machine is elongated rather than compact, such as in the case of a conveyor line, the direct noise level decreases by approximtely three dBA for each doubling of the distance of the operator from the center of the machine. For example, if the direct noise level is 102 dBA when the operator is two feet from a conveyor, it falls to 99 dBA when he moves to a distance of four feet. The reverberant sound level is constant throughout the room and does not depend on the location of the operator.

Noise levels in dBA cannot be added directly. Instead, the total sound power must be determined by adding the power from each source. The total noise level can then be calculated from the equation

$$L = 10 \log (P/C)$$

where L is the sound level in dBA, P is the sound power, and C is a constant. As an approximation, a doubling of the sound power will increase the total noise level by approximately three dBA. If a room contains two machines, each of which produces a sound level at a given position of 90 dBA, the total resulting sound level will be 93 dBA. Similarly, if the direct sound level at an operation's position is 95 dBA and the reverberant sound level is 95 dBA, the total sound level at that position will be approximately 98 dBA.

The foregoing considerations indicate that the sound level at the operator's position in a room containing machinery will be made up of the reverberant sound level and the direct sound level produced by the machines. If either noise component greatly exceeds the other, that component will be the major contributor to the total sound level and efforts to reduce the total sound level will depend on taking steps to reduce the predominating component. If both components are of comparable magnitude, reduction of the overall noise will require reduction of both components.

The direct noise level may be reduced by a properly designed shield or enclosure which separates the operator from the sound source. In some cases, it may also be possible to redesign or modify the equipment in order to decrease the direct sound power which is emitted. The reverberant level may be decreased by installing sound absorbing materials in the room in order to absorb a portion of the reverberant sound energy.

Dr. Melling concluded:

The filling rooms would require treatment to reduce both the reverberant noise level and the direct noise level. For each filling room, absorptive treatment is necessary to reduce the reverberant noise level. The absorbent material specified was a textured vinyl coated tile manufactured by Owens Corning, Inc., having an absorption coefficient of 0.6. For the bottle filling rooms, Filling Rooms III East and III West, the direct noise level could be reduced by enclosing the bottle conveyors with "Clear & Quiet" panels produced by Body Guard, Inc. The Body Guard panels are made of corrugated clear plastic, with wedges of plastic-capped foam in the corrugations. The direct noise from the crowner could be decreased by

installing a shield made of plastic material similar to that used in the Body Guard screens and the Holstein and Kappert crowner could be modified to reduce the direct noise level by rebuilding the crown injection system. For the can filling rooms, Filling Rooms I and II, the direct noise level from the seamer could be decreased by covering the seamer opening with a plastic material similar to that used in the Body Guard shields. Also, the direct noise level could be reduced by enclosing in metal enclosures hydraulic power packs, used to operate the fillers.

The engineering controls were itemized and the cost estimated by Dr. Melling as follows:

| AREA | RECOMMENDED TREATMENT | COST ESTIMATE |
|---|---|---|
| Filler Room I | 1130 $ft^2$ absorptive treatment to walls/ceilings | $ 720 |
| | Screens over seamer open areas | $ 800 |
| | Enclosures for hydraulic power packs | $2,000 |
| Filler Room 2 | 1130 $ft^2$ absorptive treatment to walls/ceilings | $ 750 |
| | Screens over seamer open areas | $ 800 |
| | Enclosures for hydraulic power packs | $2,000 |
| Filler Room III East | 2200 $ft^2$ absorptive treatment to walls/ceilings | $1,500 |
| | Bottle conveyor covers | $1,200 |
| | Conveyor screens at filler/crowner | $1,000 |

| | | |
|---|---|---|
| Filler Room III West | 2600 $ft^2$ absorptive treatment to walls/ceilings | $1,500 |
| | Modifications to H & K crowner | $3,000 |
| | Conveyor screens at filler/crowner | $1,000 |
| | TOTAL | $16,270 |

The cost estimate was obtained by Dr. Melling by talking with proposed suppliers by phone.

As an experiment to test Dr. Melling's proposals, Pabst installed the above recommended applications for Filler Room III East adding an additional 100 square feet of absorptive tile. The installation cost Pabst $9,815. Based upon the difference between Dr. Melling's cost estimate and Pabst's actual cost experience, the total cost of application of the four rooms would be $43,160 in lieu of Dr. Melling's estimate of $16,270. This would indicate a cost of the controls per employee of $1,570 per employee for Filling Room I; $1,556 per employee for Filling Room 2; $3,272 per employee for Filling Room III East; and $2,432 per employee per employee for Filling Room III West.

During the period from 1974 through October, 1977, Pabst spent a total of $6,100.90 to provide 266 employees with personal hearing protectors at an average annual cost per employee of $6.12.

Engineering predictions are made by either theoretical predictions, empirical predictions or a combination of both. A theoretical prediction is based on a fundamental analysis of physical phenomena. An example of a theoretical prediction is the knowledge that the amount of force necessary

to accelerate a mass at a given rate is equal to the product of mass and acceleration. Because theoretical predictions are based on physical phenomena fully explained, they tend to be very accurate. In many practical situations, the controlling factors are too complex to permit theoretical analysis. In such a case, it is necessary to make an empirical prediction based on experimental data correlated in an orderly fashion. With empirical predictions, it is not unusual to find errors of 20%. If theoretical predictions are used without all of the conditions known accurately or if empirical predictions are used, an error must be anticipated in the prediction. The techniques which Dr. Melling used in his study were based on theoretical equations interpreted and applied by using empirical predictions. This prediction makes heavy use of experience and calls for the application of judgment. Because judgment is involved, predictions would vary some between consultants. Dr. Melling anticipated his predictions could error as much as 2 dBA in sould level and 60% in sound power.

Dr. Melling predicted that the engineering controls which he specified could reduce the noise level in all four filling rooms to 91.5 dBA. With Dr. Melling's estimate of as much as 2 dBA error in his predictions, the actual noise level resulting from implementation of the controls could be as high as 93.5 dBA.

If the noise level in the filling rooms could be reduced to 91.5 dBA by implementing the controls specified by Dr. Melling, the allowable exposure time without personal hearing protectors would be 6.5 hours. Theoretically, a worker exposed to 91.5 dBA for 6.5 hours would not need to wear personal hearing protectors. The normal work day at Pabst consists of eight hours

with a lunch break of 30 minutes and two 15-minute coffee breaks. On days with no equipment malfunctions, the workers are exposed for seven hours. Because of the possibility of error in Dr. Melling's calculations and an exposure on some days of seven hours instead of 6.5 hours used by Dr. Melling, the filling room employees would need to continue wearing personal hearing protectors.

In assessing the effect of a change in sound level, the term "doubling rate" is used to indicate the sound level decrease, in dBA, which decreases the effect by one half. A doubling rate of three dBA is internationally recognized as the proper doubling rate to be used in assessing the effects of a change in sound level on hearing damage. Under this criterion, hearing damage is a direct function of the sound power level or the sound energy level.

Using a doubling rate of three dBA, the percent change in sound power or sound energy which results from a change in sound level from $L_1$ dBA to $L_2$ dBA is given by

$$\text{Delta P} = 100\left(\frac{10^{.1L_2}}{10^{.1L_1}} - 1\right)$$

To evaluate the effectiveness of a particular noise control, a cost-benefit ratio, in dollars per percent of sound energy reduction, may be calculated by dividing the cost of the control for each protected worker by the percent of sound energy reduction. A high ratio indicates that the control is costly compared with its benefits.

Pabst administers pre-employment audiometric tests to all new employees and annual audiometric examinations to employees who are

employed in high noise areas. If any hearing problems are detected, the company refers the employees to the company physician. Pabst has invested over $5,000 in equipment used in the hearing conservation program and spends over $3,000 annually on audiometric tests. The annual cost of the audiometric examination program is $7.58 per employee tested.

Pabst has experienced no difficulty in insuring that its employees use personal hearing protectors. No workmen's compensation claims for hearing impairment have been made.

The Secretary has never adopted any regulations, rules, interpretations, guidelines or standards to define the meaning of the term "feasible" administrative or engineering controls.

It is the Secretary's practice not to give employers any guidelines or information which identify feasible controls when a citation is issued. That practice was followed in this case.

Neither the citation nor the complaint specified the noise levels alleged to exist at the cited locations, the amount of reduction in noise levels which complainant expected Pabst to accomplish, nor any method of noise control which Pabst could implement in order to abate the alleged violations.

An abatement period cannot be specified until a specific control is identified, a supplier is located, and the delivery and installation times have been determined. The one-year abatement period proposed in this case was not based on any analysis of these factors.

The abatement period of one year in this case was selected because it was customary to set a one-year period since such a period did not require the approval of the OSHA regional office.

## ECONOMIC FEASIBILITY

The ultimate decision in the case rests upon whether the government has carried its burden of proving that the proposed engineering controls are "economically and technologically feasible." It is concluded that the Secretary has not carried that burden.

Although bound by Commission precedent[3/] it is difficult to ignore without comment the validity of respondent's argument that the term "economic feasibility" is so vague that it violates the due process clause of the Fifth Amendment. Respondent argues:

> "In order for the Commission to hold that the term 'feasible' is sufficiently definite, the meaning of the included term 'economic feasibility' must be sufficiently clear that it need not be defined by statute or regulation in order to inform an employer what he must do to avoid a violation.
>
> "The relevant criteria were stated by the Tenth Circuit, in the specific context of OSHA standards, in Brennan v. Occupational Safety and Health Review Commission, 505 F.2d 869 (10th Cir. 1974). The basis rule is:
>
>> 'A statute which is so vague that men of common intelligence must necessarily guess at its meaning and differ as to its application violates due process. This rule applies to regulations.' 505 F.2d at 872 (citations omitted).

---

3/ Continental Can Co., Inc., 76 OSAHRC 109/A2, 4 BNA OSHC 1541, 76-77 CCH OSHD ¶ 21,009 (Docket No. 3973, August 24, 1976), pet. for rev. withdrawn; Turner Co., 76 OSAHRC 108/A2, 4 BNA OSHC 1554, 76-77 CCH OSHD ¶ 21,023 (Docket No. 3635, August 24, 1976) rev. CA 7; Castle & Cooke Foods, A Division of Castle & Cooke, Inc., 77 OSAHRC 87/A2, 5 BNA OSHC 1435, 77-78 CCH OSHD ¶ 21,854 (Docket No. 10925, May 19, 1977); Union Camp Corp., 74 COSHRC 25/C5 (8/31), 1 BNA OSHC 3385, 73-74 CCH OSHD ¶ 17,576 (Docket No. 3905, May 1, 1974); Great Falls Tribune Co., 77 OSAHRC 86/B7, 5 BNA OSHC 1443, 1977-78 CCH OSHD ¶ 21,844 (Docket No. 6632, May 19, 1977).

The decision as to whether or not a standard meets this test is 'governed by the 'reasonable man' concept.' Id at 873. The noise standard is not impermissibly vague if a reasonable person could decide whether or not a noise control measure is 'economically feasible.' Respondent respectfully submits that neither complainant, respondent nor even the Commission can reasonably make that decision.

"... it should be noted that complainant has never promulgated any regulation, rule, interpretation, guideline, or standard in order to advise the public what 'feasible' means. . . .

"Respondent respectfully submits that the noise standard does not 'delineate its reach in words of common understanding.' Brennan v. Occupational Safety and Health Review Commission, 505 F.2d 869, 872 (10th Cir. 1974). When a panel of experts selected by complainant cannot agree on what 'feasible' means, and when complainant's own industrial hygienist states that 'it's a vague term' which he cannot evaluate, it would be ludicrous to hold that 'feasible' is a word of common understanding. No reasonable man, no employer, and not even a reasonable expert can be held at his peril to know what he is commanded to do by a standard which directs him to employ 'feasible' noise controls."

The Commission has stated its position in Turner Co., supra, by quoting the following except from the case of Union Camp Corporation, supra:

"Any standard given the necessary specificity, as respondent suggests, to meet the objection of one employer would by necessity contain variable factors which would call for different conclusions by different employers under different or even the same circumstances. It is manifest that engineering or administrative controls can not be specified to meet the varying noise levels of every employer. Yet all must be subject to regulation if the objective of the Act is to be achieved. How does one accomplish this objective? Requiring specifications as to how to reduce noise levels for every known sound in excess of the permissible limits would be an insurmountable obstacle to the enforcement of the Act. The objective of the Act would be totally frustrated insofar as noise exposure is concerned. Thus the standard must necessarily be expressed in general terms and depend for its application upon the circumstances of each case. The employer is required to think and use his expertise gained in the operation of his business in order to comply with the standard. This is not grounds for declaring a standard vague and unenforceable. Due process does not require that an employer be informed as to every course of action he is to take."

It is difficult to understand how the compounding of mass confusion furthers the purposes of the Act. Failure to force the government to establish guidelines in the noise field will result in many years of useless litigation with the ultimate cost passed on to the American consumers and especially the American worker already being destroyed in an economy out of control.

Respondent correctly points out that what is meant by the term "economic feasibility" will be as varied as the number of people questioned. To compound such mass confusion by failing to force the government to set forth guidelines in the noise field is especially devastating to the small employer fighting for survival in an attempt to comply with the regulations of a myriad of government agencies.[4/]

How is the small employer to handle the situtation? How is the small employer going to know how to proceed as to his noise problem? To be exact, to find out what is required under the present regulation and Commission position, ultimately requires litigation because each employer, of necessity, cannot know what "economic feasibility" means as to his individual operation. His first recourse must be an appeal to the Commission. There as is obvious in the Turner case, supra, his problem is only compounded. The Secretary contends that "economic feasibility" is limited to whether the costs of the controls would result in putting the

---

4/ Respondent points to the requirements of the Food and Drug Administration and Internal Revenue Service as two of the agencies directly involved in this case in addition to OSHA. Very little imagination is required to recognize the many other agencies with voluminous regulations affecting respondent's operation.

employer out of business. See Castle & Cooke Foods, A Division of Castle & Cooke, Inc., supra. Each Commissioner has his own ideas. Then, as in Turner, the case is reversed by the Court for the Commission to define the term "economic feasibility" as to the specific facts in issue and the whirlwind begins again. By then the complexity of the Commission has changed with a new member who probably has his own concept of what is meant by "economic feasibility." In the interim litigation costs mount and emphasize to an attorney properly representing large or small employer that his client may never know what the term "economic feasibility" means as applicable to his business because he does not have the financial resources to find out—and this is due process under the Constitution . . . to put the situation in the vernacular "Thomas Jefferson would turn over in his grave."

Again, it is mere folly to say that the government cannot tell its citizenry what is expected of them in the noise field. The Secretary in this case has brought an internationally recognized expert in the noise field from England at a probable fantastic cost to defend against the vagueness of the regulation. This witness has joined the horde of other persons in expressing his understanding of what is meant by the term "economic feasibility." If this witness can establish criteria in this case, then the government could use him to establish published regulations applicable to the industry. Rather than expend vast sums of money in expert witness fees and litigation costs, wouldn't the purposes of the Act be far greater served by recognizing that the regulation ". . . is so vague that men of common intelligence must necessarily guess at its meaning" and violates due process?

Guidelines must be established. If not done on an administrative level, it will have to be done by the Courts. The Commission rather than fulfilling its statutory role as a quasi-judicial body has attempted to establish guidelines as the alter ego of the Secretary. This function instead was placed by Congress with the Secretary who has statutory authority to make law by issuing regulations that must muster due process.

The ultimate effect of the regulation is that government is saying to its citizenry "you tell government what is meant" rather than the government telling its citizenry. For the citizenry to find out what "economic feasibility" means legally it must litigate. This is not government by and for the people, this is people subservient to and for government.

The Commission attempts to soften the impact of its position by stating to the employer, you spend what may amount to thousands of dollars to apply controls and if your efforts are unacceptable to a government inspector, your good faith attempt will be rewarded by the Commission as the proposed penalty which can not exceed $1,000 under section 17(c) of the Act will be adjusted. See footnote 12 of the Commission's decision in Turner Co., supra.

Due process ultimately means fairness. There is no way that fairness can be found regarding this regulation whether applicable to the Secretary, the Commission, the worker or the employer. Instead, ridiculous position after ridiculous position will be justified on the grounds it is a public act involving safety and health. Does such purpose justify that the basic concepts of a democracy as protected by the Constitution should be ignored? The purposes of the Act can not be furthered by attempting to uphold such a vague and indefinite regulation.

However, being bound by Commission precedent, an attempt will be made to determine whether the proposed controls in this case are "economically feasible." The Commission has expressed "economic feasibility" in terms of a "cost benefit" concept. More specifically the Commission stated in Continental Can Co., Inc., supra:

> ". . . any significant reduction in ambient noise levels which are above G-16 limits will tend to provide some protection to the hearing of employees. But we cannot overlook the fact that protection against most of the detrimental effects of excessive noise can be achieved through the use of a relatively reliable and convenient type of personal protective equipment. Additionally, the effects of excessive noise are gradual rather than sudden, and a certain amount of exposure to continuous noise levels as high as 115 dBA is permitted by the standard itself.
>
> "Other factors to be considered in the benefits which noise reduction will achieve include the number of employees exposed to excessive noise, and the net reduction in their exposure which engineering or administrative controls can reasonably be expected to produce. As to the last noted factor we would emphasize that the benefits to be obtained will vary according to the magnitude of the noise levels existing prior to the imposition of controls. Cost factors which must be considered include both the direct costs of installing and maintaining controls, and indirect costs due to any loss of productivity or efficiency resulting from their implementation. This list is not meant to be all-inclusive. We cannot here establish specific guidelines which will be applicable to all cases. The ultimate determination in each individual case must be made by weighing all the relevant factors in light of the objectives of the Act."

As to the merits, the Secretary contends:

1. Pabst exposed its employees to noise levels in excess of those listed in Table G-16.

2. Pabst failed to utilize feasible administrative or engineering controls to reduce noise levels and 21 employees were exposed to levels two to four times those listed in Table G-16.

3. The government does not have to prove that administrative or engineering controls are economically or technologically feasible, but even assuming that it does, it has carried that burden, and

4. The controls recommended by the government's expert were available at the time of the initial inspection.

In response to the Secretary's first and second arguments, Pabst concedes that the noise levels in the areas in issue exceed the levels listed in Table G-16. Instead, Pabst points to the protection afforded by personal hearing protectors and the fact such protectors lower the sound levels at least 22 dBAs below the engineering controls proposed by the expert.[5/]

The parties are in substantial disagreement as to the Secretary's third argument and it will be considered in conjunction with Pabst's contentions.

Pabst does not pursue the argument on brief that the proposed controls were not available at the time of the inspection. With exception of the H & K crowner, Dr. Melling testified that similar materials were being used in Europe prior to the inspection date.

There are other areas of controversy as to the facts that must be reconciled. Most crucial to the case is whether the proposed controls will eliminate the need for personal hearing protectors. The Secretary assumes this fact on brief and it is concluded it is not supported by the weight of the facts of record. Pabst contends that even accepting the expert's findings,

---

5/ Although the Secretary refers to administrative controls in his brief, no facts were offered that administrative controls were applicable or feasible and it has not been considered as an issue.

personal protectors must still be worn. Pabst's position is supported by admissions of Dr. Melling and testimony of Pabst's safety director. The expert's findings were based upon a 6.5 hour day and a conclusion that the controls would lower the sound levels to 91.5 dBA. The 91.5-dBA level is the maximum permissible exposure time for 6.5 hours under Table G-16. The expert admitted a margin of error and obviously there would have to be some margin of error in speculating as to the ultimate sound reduction of untested controls. This possible error was estimated by Dr. Melling at 1% to 2% in sound level or 60% in sound power (Tr. 211). Also, on some days the employees are exposed for at least seven hours. For these reasons the expert conceded:

> "Q So if in fact your prediction is off as much as 2 DB's and this is what is found when the controls are tested, then this is the allowable time. This is the average time, so that on the average they're overexposed one and a half hours, and on maximum days they're overexposed for two hours?
>
> "A Yes.
>
> "Q Now, based on all of that, if you're responsible for the safety program at this plant, surely you're not going to let the employees discontinue the use of hearing protectors? That's fair to say, isn't it?
>
> "A That's fair to say.
>
> "Q And in fact, unless you could have a very convincing safety factor in here you probably would not want [to] risk the health of your employees enough to discontinue the use of hearing protectors, is that right?
>
> "A That's right." (Tr. 219)

The parties are in disagreement as to the estimated costs of the proposed controls. Dr. Melling obtained his estimated costs by telephoning proposed suppliers. Pabst installed the proposed controls in Filling Room III

East. The actual experience of Pabst would be entitled to greater weight than cost estimates obtained by phone due to the possibility of misunderstandings and misconceptions that are likely to occur during phone conversations.[6/] Pabst's actual cost for Filling Room III East are more reliable to use as a basis for arriving at ultimate estimated costs.

In support of his contention that the proposed controls are "economically feasible," the Secretary relies heavily upon the maintenance cost of $5,000,000 expended by Pabst annually and the original equipment costs of approximately $1,800,000 to $2,000,000. The Secretary argues that one percent of capital costs of the equipment is convincing that the costs of proposed controls are "economically feasible."

Pabst argues that the "cost-benefit" concept should be applied by comparing the cost per dBA reduction per employee provided by personal hearing protectors against the cost per dBA reduction per employee provided by the proposed controls. Pabst points out that the "cost-benefit" concept must be considered in the light of whether the proposed controls will eliminate the wearing of the personal hearing protectors. Pabst emphasizes that personal hearing protectors reduce the sound levels 22 dBA below the threshold limits at a cost of $6.12 per employee, while even the Secretary's most optimistic cost figures show $592 per employee and will not eliminate the wearing of the personal hearing protectors.

---

6/ The witness recognized he was working under a time limitation and the difficulty dealing with suppliers (Tr. 198, 203). Also, the rising costs of materials due to inflation are a matter of common knowledge.

The Secretary's argument that the costs of the controls are reasonable when considered in the light of Pabst's annual maintenance costs and the capital costs of the equipment adds little to a "cost-benefit" concept. Sizeable capital and maintenance costs are at most indicative that an employer can afford the controls. Pabst does not challenge this fact and the Commission majority has rejected the Secretary's argument that "economic feasibility" is limited solely to ability to afford the controls. See Continental Can Co., Inc., supra.

Pabst's approach does add significance to a "cost-benefit" concept. If cost per dBA of reduction is considered in the light of benefit to each employee, some guideline is established that could be applicable to all employers irrespective of the size of the employer or the number of employees involved. Actually, the benefits to the individual employee in the light of the cost to the employer of the control for each employee is the crux of what a cost-benefit concept should be all about. There is no better way to ultimately determine cost-benefit than by weighing the cost of the control by the amount of sound reduction measured in terms of dBA. This approach relates directly to Table G-16 and the reality of whether the control eliminates the wearing of personal hearing protectors. Although the Commission has held that controls may be required to reduce noise levels even though the levels specified in Table G-16 are not reached, the fact that personal hearing protectors are not eliminated is a very important fact to consider as to the benefit of the control to the employee. Actually from a "cost-benefit" concept the fact that the personal hearing protectors are not eliminated should be one of the more important considerations. If personal

protectors are not eliminated, the benefit of the proposed control to the employee is at best minimal. This fact was recognized by the Commission in the following quote from Continental Can Co., Inc., supra, that ". . . we cannot overlook the fact that protection against most of the detrimental effects of excessive noise can be achieved through the use of a relatively reliable and convenient type of personal protective equipment."

As stated, unless the cost-benefit concept is applied on the basis of cost per dBA of reduction in the light of benefit to each employee, the concept can not be made consistently applicable to all employers. By this approach, a definite guideline is established and there is better possibility of equal and fair application of the regulation to all employers, irrespective of size or the number of employees affected.

The higher the ratio between the costs of the proposed controls and the costs of personal hearing protectors in situations where the protectors are not eliminated, the greater the indication that the costs are excessive and the benefit minimal. The facts in the instant case emphasize the importance of the recognition of inexpensive personal hearing protectors especially where the controls fail to eliminate their use. The facts of record show that the personal hearing protectors cost $6.12 per employee. The Secretary's most optimistic cost shows $592 per employee. The personal hearing protector will reduce the noise conservatively to 68 dBA or 23.5 dBA lower than the Secretary's most optimistic assumed results. Pabst breaks down its comparative cost-benefit argument even further by comparing costs on the basis of percentage of sound removed by hearing protectors as against the proposed controls. This comparison indicates a cost-benefit

ratio for hearing protectors of six cents versus $6.50 to $13.89 depending on the filling room involved. The results become of even greater magnitude when the reduction of percentage of sound between the protectors and proposed controls are compared.

The expert testified:

> "Q Looking at it strictly from the standpoint of economic feasibility, though, if I can get down to 68 dBA at a cost of $6.12, you agree with me that purely on an economic basis, given the choice of these two, the economic choice, of course, must be hearing protectors?
>
> "A Yes.
>
> "Q And I think you said earlier that really, hearing protectors, anytime this is an allowable choice, is bound to be the better economic choice?
>
> "A Yes.
>
> "Q On an economic basis, there's no question in your mind that hearing protectors are economically the preferable choice?
>
> "A In this instance, yes." (Tr. 301).

The facts indicate in the instant case an extremely high costs ratio and the protectors must still be worn. When these facts are weighed in the light of the admissions of the government's expert witness as to cost-benefit concepts, the only logical legal conclusion remaining is that the Secretary has failed to carry his burden of proving that the proposed engineering controls are "economically feasible."

## ENGINEERING FEASIBILITY

Pabst questions whether the acoustical tile and the Body Guard shield can be used in its plant because of sanitation problems. It relies upon Great Falls Tribune, supra, holding that the Secretary's burden includes proof that

the proposed controls can be used in the employer's workplace.

Dr. Melling testified that the Body Guard could be designed without the acoustical material. Although this testimony is an ultimate conclusion of fact, in view of his expertise, the statement is accepted as sufficient to carry the Secretary's burden.

However, a different conclusion must be drawn regarding the acoustical tile.

Dr. Melling did not determine the working environment in the filling rooms. He did not determine the hazard involved from movement of cartons, ladders or other devices that might damage the tile. Although he testified the tile was intended to be placed higher than the workmen, this does not assure that cartons and the necessity to use ladders would not damage the tile. Obviously, a vinyl coating no thicker than one thousandth of an inch would be very susceptible to sharp edges or an object exerting even slight pressure. Dr. Melling's statement that the tile had been used in breweries in Europe or on offshore platforms is not sufficient to shift the burden back to Pabst to go forward with the evidence, much less sufficient to carry the Secretary's burden of persuasion. The reason, of course, is that the Secretary failed to lay foundation that Dr. Melling knew the working conditions at Pabst or that the breweries in Europe were the same in design as Pabst's facility and, of course, there was no foundation laid that the operation at Pabst has any bearing to offshore platforms. To emphasize the problem with the Secretary's failure of proof, Dr. Melling's pertinent testimony was as follows:

"Q All right. Now, again, in answer to my question, just so we'll have it on the record, you don't know of any breweries using the H & K Crowner in America - - - I'm sorry, modification of the H & K Crowner?

"A No I don't.

Q How many breweries, what fraction of breweries in America use the acoustical tile that you suggest of your own knowledge?

"A I don't know.

"Q How many breweries in America have enclosed hydraulic power packs to your knowledge, what fraction of them?

"A I don't know.

"Q Now, I'm leaving something out, Dr. Melling, what is it? Oh, Body Guard, how many breweries in America to your knowledge are using Body Guard on the conveyors?

"A I don't know.

"Q Do you know how many breweries in America have shielded, covered the bottom of the seamer in America?

"A No.

"Q So that with regard to Pabst, in terms of these specific modifications, you're not able to evaluate how widely any of these are used in America in breweries?

"A Given time I could find out, yes.

"Q Right, but I mean here today?

"A Here today, no." (Tr. 229, 230)

"Q If the - - - let's be sure the Court understands what we're talking about with the tile now. Acoustical tile normally is very porous and very absorbant, right?

"A Yes.

"Q As it needs to be to be a good sound absorber?

"A Right.

"Q So that this material up here, if I put it in a bucket of paint would soak that paint up rapidly, right?

"A Yes.

"Q It would be kind of like the television commercial that one of the flouride (sic) toothpastes puts on where they take a piece of chalk and they put it in a dye and very, very quickly you get a colored ring, right?

"A Yes.

"Q Now, the only way that you can put this tile in the Pabst Brewery is by preventing that kind of thing, right?

"A Yes.

"Q Because if material starts sopping up in there you'd have a terrible sanitation problem, right?

"A Yes.

"Q And the FDA would be on your neck, true?

"A I believe so.

"Q So what's been done here it to coat this tile with an impervious vinyl film, correct?

"A Yes.

"Q How thick is that film?

"A It's of the order of thousands of an inch.

"Q A couple of mils, maybe?

"A Umh.

"Q Two thousandths of an inch thick?

"A Yes.

"Q And if you make it a thick film, of course, then the tile would no longer function as an acoustical absorbant?

"A Correct.

"Q So we have here a vinyl film maybe .001 to .002 inches thich (sic)?

"A Yes.

* * *

"Q Now, I can take my thumb nail and scrape it across this film and destroy it very easily?

"A Yes.

"Q So that if someone comes into the bottling plant with a stack of beer bottles and happens to rub across the surface of that film it would damage it, wouldn't it?

"A It would indeed, but let's get this into perspective. That treatment is quite high up, it deliberately placed above head height, etcetera so it will be reasonably free from damage.

"Q And how many times do people bring ladders, big stacks of cartons in there that would go up above the level of the tile?

"A In the case of Pabst, I have no idea.

"Q But you wouldn't be surprised it does occur from time to time?

"A I wouldn't be surprised.

* * *

"Q But from what you know of this material, you wouldn't disagree with me that it may or may not prove structurally satisfactory at the Pabst plant? You know it will absorb noise, but you don't know whether it's going to prove that it's too easily damaged to stay up, isn't that true, Dr. Melling?

"A I would agree with you, yes." (Tr. 231-234)

* * *

"Q No, how long would you expect the material to last in place?

"A Well, again I can call on my experience back in the United Kingdon (sic) where we have used similar materials not only in breweries, but offshore platforms, which I'm sure you will accept as being a more rugged environment than a brewery. It's been very satisfactory and very little damage." (Tr. 314).

On the basis of the overall record, it must be concluded that the Secretary has failed to carry his burden of persuasion that the acoustical tile is a feasible engineering control adaptable to Pabst's operation.

## ULTIMATE CONCLUSIONS OF FACT, LAW, DECISION AND ORDER

1. Respondent is engaged in a business affecting commerce within the meaning of section 3(5) of the Act.

2. The Commission has jurisdiction over the parties and the proceeding.

3. On March 12, 1975, the noise levels in Filling Rooms I, 2, III East and III West of respondent's packaging center exceeded the limits of Table G-16 of 29 C.F.R. § 1910.95(b)(1).

4. The employees exposed to the noise levels in Filling Rooms I, 2, III East and III West were protected by personal protective equipment.

5. Due to the high cost ratio between the engineering controls proposed by the Secretary and the personal hearing protectors where the controls will not eliminate the wearing of the protectors, the Secretary has failed to prove that the costs of the proposed controls are feasible when weighed in the light of the benefits to the employee.

6. The Secretary has failed to prove that on March 12, 1975, and January 10, 1978, that economically feasible engineering controls existed for use in Filling Rooms I, 2, III East and III West of respondent's packaging center at Perry, Georgia.

7. The Secretary has failed to prove that acoustical tile was technologically feasible for installation on March 10, 1975, and January 10,

1978, in Filling Rooms I, 2, III East and III West of respondent's packaging center at Perry, Georgia.

8. The respondent was not in violation of section 5(a)(2) of the Act for failure to conform with 29 C.F.R. § 1910.95(b)(1).

## DECISION AND ORDER

Wherefore it is ORDERED:

The citation issued on April 7, 1975, is vacated and no penalty is assessed.

Dated this 25th day of July, 1978.

ORDER OF REMAND

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

On December 17, 1982, the Commission issued its decision in Sun Ship, Inc., OSHRC Docket No. 16118. In accordance with the decision of the U.S. Supreme Court in American Textile Manufacturers Institute, Inc. v. Donovan, 101 S.Ct. 2478 (1981)("ATMI"), the Commission held that "feasible" under the occupational noise standard means achievable. The Commission overruled the cost-benefit test of feasibility previously set forth in Continental Can Co., 76 OSAHRC 109/A2, 4 BNA OSHC 1541, 1976-77 CCH OSHD ¶ 21,009 (No. 3973, 1976), appeal withdrawn, No. 76-3229 (9th Cir. Apr. 26, 1977), and substituted a test consistent with ATMI.

In view of this intervening change in law, the judge's decision with respect to the single-facer and double-backer operators is vacated. The case is remanded for further proceedings, including evidentiary submissions, so that the interre-

lated issues of technological and economic feasibility can be reconsidered in light of the test of feasibility established by Sun Ship, Inc. 1/

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: DEC 23 1982

---

1/ Chairman Rowland dissents. He would not remand the case for further proceedings. Consistent with his dissenting opinion in Sun Ship, he concludes that the requirement in section 1910.95(b)(1) that feasible administrative or engineering controls be utilized is invalid.

APPEARANCES:

Daniel A. Caldwell, Esquire, Office of the Solicitor, U. S. Department of Labor, Atlanta, Georgia, on behalf of complainant

Robert L. Greenwald, Esquire, Chicago, Illinois, on behalf of respondent

## DECISION ON REMAND

BURROUGHS, Judge: The Commission, by order dated April 27, 1981, remanded this case for consideration of the issue of whether respondent filed a timely Notice of Contest to a citation issued to it on August 28, 1975, for allegedly violating provisions of the noise standard, 29 C.F.R. § 1910.95(b), during operations at its Lithonia, Georgia, plant. At the nearing held on March 1 and 2, 1976, complainant's Motion to Dismiss the Notice of Contest was denied and a hearing on the merits proceeded. The Judge's Decision and Order issued on November 3, 1976, affirmed a violation of 29 C.F.R. § 1910.95(b).

Subsequent to the remand, the parties decided to have the issue resolved without the necessity of a trial. On June 24, 1981, an executed Stipulation of Facts was received from the parties. In support of its position, respondent attached to

the Stipulation of Facts the affidavits of Robert L. Greenwald, respondent's counsel; Laurence J. Smith, the personnel manager of the Lithonia plant; and J. Lester Ross, respondent's manager of loss control at the time the citation was issued. In support of his position, complainant attached a copy of an October 22, 1975, letter from respondent's counsel to the Commission and a copy of respondent's Response in Opposition to Motion to Dismiss Notice of Contest and for Extension of Time in Which to File a Complaint.

Section 10(a) of the Act, 29 U.S.C. § 659(a),[1/] sets a firm time limit for contesting a citation issued pursuant to the Act. The employer must notify the Secretary within fifteen working days from receipt of the citation. The failure to file a Notice of Contest within fifteen working days divests the Commission of jurisdiction to hear merits of the citation, which becomes final by operation of law pursuant to section 10(a). Capital City Excavating Co., 80 OSAHRC 83/A10, 8 BNA OSHC 2009, 1980 CCH OSHD ¶ 24,734 (No. 78-4725, 1980); Kerr-McGee Chemical Corp., 76 OSAHRC 129/C14, 4 BNA OSHC 1739, 1976-77 CCH OSHD ¶ 21,161 (No. 9890, 1976).

---

1/ Section 10(a) of the Act provides:

> If, after an inspection or investigation, the Secretary issues a citation under section 9(a), he shall, within a reasonable time after the termination of such inspection or investigation, notify the employer by certified mail of the penalty, if any, proposed to be assessed under section 17 and that the employer has fifteen working days within which to notify the Secretary that he wishes to contest the citation or proposed assessment of penalty. If, within fifteen working days from the receipt of the notice issued by the Secretary the employer fails to notify the Secretary that he intends to contest the citation or proposed assessment of penalty, and no notice is filed by any employee or representative of employees under subsection (c) within such time, the citation and the assessment, as proposed, shall be deemed a final order of the Commission and not subject to review by any court or agency.

A nonserious citation was issued to respondent on August 28, 1975. The citation was received by respondent on September 2, 1975, at its Lithonia, Georgia, plant. An undated Notice of Contest, contained in an envelope having a postmark date of September 24, 1975, was received by OSHA's area office in Tucker, Georgia, on September 25, 1975. Both parties agree that a timely Notice of Contest was required to be mailed by respondent on or before September 23, 1975. These facts establish a prima facie case by complainant that the Notice of Contest was untimely. Kerr-McGee Chemical Corp., supra. "While the postmark represents 'prima facie' evidence of untimeliness, an employer can rebut this evidence by demonstrating that the notice of contest was mailed on a date other than that contained in the postmark." Newport News Shipbuilding & Drydock Company, 80 OSAHRC 119/A2, 9 BNA OSHC 1085 at 1088, 1980 CCH OSHD ¶ 25,003 (No. 76-171, 1980).

The Commission has held that it is the date of mailing, not the actual postmark, that is the decisive factor. Newport News Shipbuilding & Drydock Company, supra; J. D. Blum Construction Co., 76 OSAHRC 58/D14, 4 BNA OSHC 1255, 1976-77 CCH OSHD ¶ 20,735 (No. 3543, 1976). Respondent submits that while the letter was postmarked on September 24, 1975, it was actually mailed between the hours of 5:00 p.m. and 6:00 p.m. on September 23, 1975, which made the Notice of Contest timely. In support of the September 23, 1975, mailing date, respondent submitted the affidavit of Laurence J. Smith, the personnel manager of the Lithonia, Georgia, plant. Smith states in his affidavit that he had the responsibility for mailing the Notice of Contest. His affidavit, in pertinent part, states as follows:

> 3. On September 23, 1975, I therefore deposited at the U. S. Post Office located at 3035 Mountain Street, Lithonia, Georgia 30058, Stone Container Corporation's said Notice of Contest, a copy of which is attached hereto.

4. Said Notice of Contest was signed by Mr. J. Don Cason, the Plant Manager, and was not dated. I then proceeded to run the envelope containing the Notice of Contest through the Company's post office meter, which had already been advanced to the date of September 24, 1975, as was often done, since it was late in the afternoon on the 23rd of September, 1975.

5. After having the envelope stamped with the proper postage, I personally deposited it in the mail box outside the Lithonia, Georgia Post Office located at 3035 Stone Mountain Street, Lithonia, Georgia 30058 sometime between the hours of 5:00 and 6:00 P.M. on September 23, 1975.

The affidavit of J. Lester Ross supports the affidavit of Smith. Ross had the responsibility of determining the proper response to the citation. According to his affidavit, he delayed filing a Notice of Contest so that he might have an opportunity to discuss a possible resolution of the citation with the Atlanta area director for OSHA. Ross further states that on September 22, 1975, he instructed Smith to prepare a Notice of Contest and that on September 23, 1975, he called Smith to instruct him to deposit the Notice of Contest in the mail on that date. On September 25, 1975, Ross called Smith and was advised by Smith that he deposited the Notice of Contest in the mailbox outside the Lithonia, Georgia, post office on September 23, 1975.

The postmark date of September 24, 1975, was stamped by a Pitney-Bowes postage meter which was under the exclusive control of respondent. The postage meter was designed to let respondent change the postmark date to be stamped. Complainant argues that the affidavits of Smith and Ross are insufficient to rebut the presumption that the Notice of Contest was mailed on September 24, 1975, since the postmark date was within the control of respondent and not the post office. Complainant seeks to distinguish the rationale of the Commission in Newport News Shipbuilding & Drydock Company, supra, on the basis that the postmark date in that case was made by the U. S. Postal Service. This fallacious

reasoning overlooks the main import of the Newport News decision; namely, the date of mailing is controlling. There is no credible evidence to rebut Smith's representation that he deposited the letter in the mailbox outside the Lithonia, Georgia, post office sometime between the hours of 5:00 p.m. and 6:00 p.m. on September 23, 1975.

Complainant further points to the fact that respondent, at the time the Notice of Contest envelope was postmarked, had no standard practice regarding whether the postmark date on its Pitney-Bowes meter was changed at the end of the business day or at the beginning of the next business day. Respondent currently changes the postmark date on its postage meter at the commencement of the business day corresponding to the postmark date. These facts are not in conflict with Smith's affidavit and form no basis on which to conclude that he was mistaken in saying that he mailed the letter on September 23, 1975.

Complainant's last argument is premised on certain statements made by respondent's counsel in his document entitled "Response In Opposition To Dismiss Notice Of Contest And For Extension Of Time Within Which To File A Complaint" and the letter dated October 22, 1975, forwarding the document. The letter of October 22, 1975, states that "the Notice of Contest was placed in the hands of the Lithonia Post Office on September 23, 1975," and that "the Post Office failed to postmark the Notice of Contest until the following day." The Response In Opposition To Dismiss Notice of Contest states that the Notice of Contest was hand delivered to the Lithonia Post Office in Lithonia, Georgia, at 4:00 p.m. on September 23, 1975. It is obvious that counsel was not as well versed with the facts as he should have been prior to making his representations, but his lack of preparedness does not negate the representation of Smith.

There is no evidence to conclude that counsel was informed that the envelope bearing the Notice of Contest was postmarked by a postage meter owned by respondent. Once Smith represented to respondent's counsel that he had mailed the letter on September 23, 1975, counsel probably assumed the postmark was made by the postal service.

The affidavit of Laurence Smith is a sufficient basis to conclude that respondent timely contested the citation within the fifteen working day period of section 10(a) of the Act. The Motion to Dismiss the Notice of Contest as untimely is again dismissed.

## FINDINGS OF FACT

The following findings of fact are based on the Stipulation of Facts filed by the parties on June 24, 1981:

1. Respondent was issued a nonserious citation on August 28, 1975, that was received by it at its Lithonia, Georgia, plant on September 2, 1975.

2. Respondent's undated Notice of Contest was received by the OSHA area office in Tucker, Georgia, on September 25, 1975.

3. The envelope containing the Notice of Contest bore a postmark date of September 24, 1975. The postmark date was made by a Pitney-Bowes postage meter under the exclusive control of respondent.

4. The envelope was run through the postage meter at the close of business on September 23, 1975, after the meter had been advanced forward for the next business day, September 24, 1975.

5. The personnel manager of the Lithonia, Georgia, plant deposited the envelope containing the undated Notice of Contest in the mailbox outside the

Lithonia, Georgia, post office sometime between the hours of 5:00 p.m. and 6:00 p.m. on September 23, 1975.

## CONCLUSIONS OF LAW

1. Respondent, at all times material hereto, was engaged in a business affecting commerce within the meaning of section 3(5) of the Act.

2. Respondent, at all times material hereto, was subject to the requirements of the Act and the standards promulgated thereunder. The Commission has jurisdiction of the parties and of the subject matter herein.

3. Respondent's Notice of Contest was mailed on September 23, 1975, and was timely within the requirements of section 10(a) of the Act.

## ORDER

Upon the basis of the foregoing findings of fact and conclusions of law, it is

ORDERED: That respondent's Notice of Contest was timely filed and the Motion to Dismiss is denied.

Dated this 25th day of August, 1981.

James D. Burroughs

JAMES D. BURROUGHS
Judge

| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>RUSSELL, BURDSALL & WARD, INCORPORATED,<br><br>Respondent. | OSHRC Docket No. 76-2958 |

ORDER OF REMAND

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

On December 17, 1982, the Commission issued its decision in Sun Ship, Inc., OSHRC Docket No. 16118. In accordance with the decision of the U.S. Supreme Court in American Textile Manufacturers Institute, Inc. v. Donovan, 101 S.Ct. 2478 (1981)("ATMI"), the Commission held that "feasible" under the occupational noise standard means achievable. The Commission overruled the cost-benefit test of feasibility previously set forth in Continental Can Co., 76 OSAHRC 109/A2, 4 BNA OSHC 1541, 1976-77 CCH OSHD ¶ 21,009 (No. 3973, 1976), appeal withdrawn, No. 76-3229 (9th Cir. Apr. 26, 1977), and substituted a test consistent with ATMI.

In view of this intervening change in law, the judge's decision is vacated with respect to the allegation concerning engineering controls. The case is remanded for further proceedings, including evidentiary submissions, so that the

interrelated issues of technological and economic feasibility can be reconsidered in light of the test of feasibility established by Sun Ship, Inc. 1/

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: DEC 23 1982

---

1/ Chairman Rowland dissents. He would not remand the case for further proceedings. Consistent with his dissenting opinion in Sun Ship, he concludes that the requirement in section 1910.95(b)(1) that feasible administrative or engineering controls be utilized is invalid.

Appearances:

Gregory B. Taylor, Esquire, for Complainant

Francis Carling, Esquire, for Respondent

Edward F. Fitz, President, U.A.W. Local 843,
Authorized Employee Representative

STATEMENT OF THE CASE

Rubin, Judge

Respondent corporation manufactures industrial fasteners in Mentor, Ohio. On April 14 and 15, 1976, a Department of Labor compliance officer inspected respondent's plant and issued a citation alleging two non-serious violations (Docket No. 76-2957), and a notification of failure to correct alleged violation (Docket No. 76-2958).

Docket No. 76-2957 was settled by agreement of the parties. Respondent represents that the alleged violations have been abated (T 8-9). The agreement is incorporated in this order.

Docket No. 76-2958 charges respondent with failure to correct a violation of 29 CFR 1910.95(b)(1) and (3) as alleged in amended citation dated February 20, 1974 (Ex. C-1).[1/] A penalty of $1,350 was proposed.

## STANDARD AND CITATION

29 CFR 1910.95 pertains to occupational noise exposure.

> "(a) Protection against the effects of noise exposure shall be provided when the sound levels exceed those shown in Table G-16 when measured on the A scale of a standard sound level meter at slow response. . .
>
> (b)(1) When employees are subjected to sound exceeding those listed in Table G-16, feasible administrative or engineering controls shall be utilized. If such controls fail to reduce sound levels within the levels of Table G-16, personal protective equipment shall be provided and used to reduce sound levels within the levels of the table.
>
> (2) If the variations in noise level involve maxima at intervals of 1 second or less, it is to be considered continuous.
>
> (3) In all cases where the sound levels exceed the values shown herein, a continuing, effective hearing conservation program shall be administered.

---

1/ The complaint refers to failure to correct a violation cited on January 31, 1974. This citation was superseded by amended citation dated February 20, 1974. Complainant's motion to amend the complaint was granted (T 9-10).

Table G-16--Permissible Noise Exposures[1]

| Duration per day, hours | Sound level dBA slow response |
|---|---|
| 8 | 90 |
| 6 | 92 |
| 4 | 95 |
| 3 | 97 |
| 2 | 100 |
| 1-1/2 | 102 |
| 1 | 105 |
| 1/2 | 110 |
| 1/4 or less | 115 |

[1]When the daily noise exposure is composed of two or more periods of noise exposure of different levels, their combined effect should be considered, rather than the individual effect of each. If the sum of the following fractions: C1/T1+C2/T2. . . Cn/Tn exceeds unity, then, the mixed exposure should be considered to exceed the limit value. Cn indicates the total time of exposure at a specified noise level, and Tn indicates the total time of exposure permitted at that level.

Exposure to impulsive or impact noise should not exceed 140 dB peak sound pressure level."

The amended citation, dated February 20, 1974, alleges that respondent:

> Failed to use feasible administrative or engineering controls to reduce the sound levels within the permissible limits.
>
> Locations.
>
> Department 66 (Extrusion)
> Machine Nos. 536-538
>
> Department 55 (Roll Thread Sems)
> Machine Nos. 776-772-774

Department 51 (Bolt Maker)
Column J-36

Department 51 (Header Operator)
Machine Nos. 213-210

Also, the employer failed to require the proper use of personal hearing protection equipment to reduce the sound levels within the permissible limits. (29 CFR 1910.95(b)(1) and (3)).

EVIDENCE AND DISCUSSION

The parties have stipulated that the citation dated February 20, 1974 became a final order of the Review Commission; that the machines cited in this present proceeding are the same machines cited on February 20, 1974; that the sound levels produced by the cited machines exceeded the permissible limits in the standard at the time of the original inspection and upon reinspection; that the sound levels were 94 and 95 dBA on April 14 and 15, 1976; that administrative controls are not feasible;[2/] that engineering controls are theoretically feasible; and that the machine operators were wearing ear plugs on April 14 and 15, 1976. The machine originally identified as Bolt Maker, Column J-36, Department 51, was relocated and in Department 50 at the time of the reinspection (T 10-11, 14-15, 40-43, Ex. C-2).

2/ Transcript p. 14, line 12, is corrected to add "not" between "are" and "feasible". The record is further corrected to show errata listed in complainant's letter dated April 19, 1977.

Norman L. Meyerson, Senior Engineer and Vice President of Ostergaard Associates, Consultants in Acoustics, testified as complainant's sole witness. Meyerson surveyed respondent's plant on November 30, 1976 for the purpose of investigating the feasibility of engineering controls. His report includes a summary of noise measurements, general observations, analysis, and evaluation of engineering solutions (Ex. C-3). Meyerson was of the opinion that a significant noise reduction of 15 dBA or more can be achieved by the installation of sound enclosures on each of the eight machines cited. The noise levels at each machine would thereby be reduced to 90 dBA or below. However, the operators of these machines will continue to be exposed to excessive noise levels from the adjacent machines. To reduce exposure of these employees to within the standard limits, it is necessary to enclose two machines on each side of each cited machine. Respondent's study indicates that the problem is plant-wide with 228 machines producing noise in excess of the standard levels (T 162-163). Complainant would limit the issue to the technological feasibility of abatement for the eight machines cited. Respondent insists that the 228 machines must be considered and that engineering controls, while theoretically feasible, are not economically feasible.

Savina Home Industries, Inc., OSHRC Docket No. 12298 (RC January 1977) sets forth the proof needed to establish a failure to abate where the original citation was not timely contested. Complainant's prima facie case is made upon a showing that: "(1) the original citation has become a final order of the Commission, and (2) the condition or hazard found upon reinspection is the identical one for which respondent was originally cited. An employer may rebut this prima facie case by showing that the condition has in fact been corrected or, if not corrected, that the employer has prevented the exposure of his employees to the violative condition. Secretary v. York Metal Finishing Company, 7 OSAHRC 845 (1974). The prima facie case may also be rebutted by a showing that the condition for which the employer was cited was in fact not violative of the Act either at the time of the original inspection or at the time of reinspection. Secretary v. Franklin Lumber Co., Inc., 9 OSAHRC 922 (1974)."

A divided Review Commission has held that the economic as well as technological feasibility of noise reduction controls must be considered. Continental Can Company, 76 OSHRC 109/A2, 4 BNA OSHC 1541, 1976-77 CCH OSHD para. 21,009 (No. 3973, etal, 1976), pet. for review withdrawn, No. 76-3229, 9th Cir., April 26, 1977;

Castle & Cooke Foods, Inc., 77 OSHRC 87/A2, 5 BNA OSHC 1435, 1977-78, CCH OSHD para. 21,854 (No. 10925, May 19, 1977), pet. for review filed, No. 77-2565, 9ty Cir., July 14, 1977. The Commission's interpretation of the term "feasibility" was approved in Turner Company v. Secretary of Labor and OSHRC, 561 F.2d 82 (7th Cir., 1977), and is applied here.

The eight machines cited appear to have been selected at random. Complainant has offered no explanation for the selection of these particular machines and for the omission of over 200 similar noise-producing machines found throughout respondent's plant. A rational basis for this piecemeal approach is not evident. The approach is rejected as economically wasteful and tending to vitiate the decisions of the Review Commission with respect to the economic factor. Accordingly, economic feasibility will be considered as it pertains to the entire plant.

Meyerson estimated the cost of eight enclosures as $20,800 to $35,250, depending upon which of his proposed alternatives are adopted. Using Meyerson's estimates, we find that enclsing 228 machines will cost from approximately $600,000 to $1,000,000. Respondent has challenged the effectiveness of the enclosures recommended by Meyerson and asserts that more expensive,

custom-designed enclosures are necessary. Respondent also includes additional expenses for machinery relocation, installation, etc. It is not necessary to resolve these differences to reach a decision on economic feasibility since substantially greater expenses on a continuing basis are anticipated due to increased maintenance costs and decreased productivity.

Meyerson estimated increased maintenance costs of 3% annually and decreased annual productivity of 5% (T 55-56). Using the 3% estimate, respondent computed increased maintenance costs in the bolt maker department at $7,000 annually (T 172-173). The computation is not refuted. The bolt maker department has 22 machines. Assuming that maintenance costs are comparable for the remaining 206 machines, the annual increased maintenance cost is $70,000. Respondent has computed the loss of sales capacity due to reduced productivity in the bolt maker department and extrapolates therefrom a total loss of $6,000,000 annually for all machines. This figure is deemed excessive in view of the total net sales reported in fiscal 1975, 1976 and the first half of 1977 (Ex. R-3). While a precise figure cannot be determined, the loss in sales capacity due to a 5% decrease in productivity is estimated at $1,250,000 annually on the basis of the total net sales reported.

The record further shows that respondent instituted a mandatory program of wearing hearing protectors in designated areas of the plant. Company regulations have been issued providing for disciplinary action and penalties for failure to wear the hearing protectors. Sueprvisors make two inspections per shift to see that the men are wearing the ear protectors, and a number of warnings were issued for failure to do so (T 105, 108; Ex. R-5 Compliance Program, Attachments A through F). Three different sizes of ear plugs are provided, and the plugs are fitted by a nurse (T 114). Audiometric tests commenced in December 1973 and this program has since been augmented. Respondent has contracted with an outside hearing consultant firm to evaluate the audiograms on a yearly basis (T 108-109).

In 1974, respondent instigated a joint effort by the fastener industry to develop a technology for noise control. The fastener industry noise control research program (FINCRP) retained consultants to study the noise problems presented by the standard machines in industry-wide use (T 118-124). Meyerson expressed the opinion that the study report was "a more thorough study than all surveys that I ever saw in the fastening industry done before" (T 60). The first phase has been completed, and the program has entered

a phase of prototype design, fabrication, installation and evaluation. Experimental noise treatment will be applied to 22 machines in industry-wide use under actual operating conditions (T 124-126). It is estimated that phase two will be completed by March 1979 (T 124-129). Respondent could not assure that the study will be implemented. This would depend on the technical performance and economic costs of the controls recommended (T 133).

Respondent's ability to absorb the costs of abatement must be examined against a background of reduced employment and operating losses. On June 26, 1976, the U. S. Department of Labor issued a certificate of eligibility to apply for adjustment assistance under the Trade Act of 1974. Petition for such relief was filed by the United Auto Workers for worker adjustment assistance for employees and former employees of the Mentor plant. The Department of Labor round a significant number of total or partial separations of production and salaried workers in 1975 and 1976; sales or production, or both, decreased absolutely in 1975 and 1976; imports increased absolutely and relatively in 1974 and 1975 (Ex. R-2). Respondent began production in the Mentor plant in March 1973. At first, the plant operated at a loss, showed a profit in 1974, again suffered a loss

in fiscal 1976 and a greater loss proportionately in the first half of fiscal 1977 (Ex. R-3). The corporation had a net profit nationwide in fiscal 1976 (Ex. C-9).

In Castle & Cooke Foods, Inc., supra, the Review Commission held that the benefits do not justify the cost of controls where the implementation cost was $3,100-$3,400 per employee and the annual cost impact was $111-$1,100 per employee. In that case, the noise levels ranged from 95-101 dBA. Here, the number of employees exposed to excessive noise levels is somewhat less than 234.[3/] Using the 234 figure and Meyerson's estimates for installation projected for 228 enclosures, and the annual expenses for maintenance and reduced productivity - the cost of engineering controls per employee is as follows: implementation cost - $2,500 to $4,250; annual cost impact - $5,600. The parties have stipulated that the inspection on April 14 and 15, 1976, which gave rise to the citation, recorded noise levels in the 94-95 dBA range.

The cost-benefit factors considered in Castle & Cooke Foods, Inc. apply a fortiori here where the costs are greater and benefits less. Accordingly, it is held that engineering controls are not economically feasible.

---

3/ Exhibit R-5, Attachment A, shows that upon completion of the personal hearing protection equipment program on February 19, 1974, 234 employees had received earplugs. Exhibit R-3, p. 2, shows a 30.4% decrease in employment of production workers in 1975 from 1974 and further reduction in 1976.

Respondent argues that the FINCRP study is a viable alternative with distinct economic advantages over complainant's approach. This is a collateral argument which bears primarily on the question of a variance, a matter which is solely under the jurisdiction of the Secretary of Labor. Since the study has not been completed, its application herein cannot be evaluated in terms of economic feasibility.

## FINDINGS OF FACT

1. Respondent is a corporation which manufactures industrial fasteners in Mentor, Ohio.

2. Products bought and sold by respondent are shipped in interstate commerce.

3. An amended citation dated February 20, 1974, which charged a violation of 29 CFR 1910.95(b)(1) and (3) was not contested by respondent and became a final order of the Review Commission.

4. Reinspection of respondent's plant on April 14 and 15, 1976 disclosed that the machines previously cited continued to produce noise levels in excess of the permissible noise levels listed in Table G-16 of the standard.

5. Respondent's employees were exposed to excessive noise levels in Department 66 at Machine Nos. 536-538, Department 55 at Machine Nos. 776-772-774,

Department 51 Bolt Maker at Column J-36, Department 51 at Machine Nos. 213-210 at the time of the initial inspection and upon reinspection.

6. At the time of reinspection, respondent was administering a continuing, effective hearing conservation program.

7. Administrative controls are not feasible.

8. Machine enclosures will reduce noise levels to 90 dBA or below.

9. Engineering controls are technologically but not economically feasible.

## CONCLUSIONS OF LAW

1. Respondent is and, at all times relevant herein, was an employer engaged in a business affecting commerce within the meaning of Section 3(5) of the Act.

2. The Occupational Safety and Health Review Commission has jurisdiction of the parties and subject matter pursuant to Section 10(c) of the Act.

3. Feasible administrative or engineering controls are not available for utilization within the meaning of 29 CFR 1910.95(b)(1).

4. Respondent was not in violation of 29 CFR 1910.95(b)(3) at the time of reinspection.

## ORDER

OSHRC Docket No. 76-2957

1. Items 1 and 2 of citation 1 are affirmed.

2. A penalty in the amount of $200.00 is assessed.

3. Respondent's Motion to Withdraw its notice of contest is granted.

OSHRC Docket No. 76-2958

1. Notification of Failure to Correct Alleged Violation and of Proposed Additional Penalty is vacated.

ORDER OF REMAND

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

On December 17, 1982, the Commission issued its decision in Sun Ship, Inc., OSHRC Docket No. 16118. In accordance with the decision of the U.S. Supreme Court in American Textile Manufacturing Institute, Inc. v. Donovan, 101 S.Ct. 2478 (1981) ("ATMI"), the Commission held that "feasible" under the occupational noise standard means achievable. The Commission overruled the cost-benefit test of feasibility previously set forth in Continental Can Co., 76 OSAHRC 109/A2, 4 BNA OSHC 1541, 1976-77 CCH OSHD ¶ 21,009 (No. 3973, 1976), appeal withdrawn, No. 76-3229 (9th Cir. Apr. 26, 1977), and substituted a test consistent with ATMI.

In view of this intervening change in law, the judge's decision with respect to the alleged violation of section 1910.95(b)(1) is vacated. The case is remanded for further proceedings, including evidentiary submissions, so that the interrelated issues of technological and economic

feasibility can be reconsidered in light of the test of feasibility established by Sun Ship, Inc.[1/]

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: DEC 23 1982

DECISION AND ORDER

MARTIN, Judge:

This matter arises under Section 10(c) of the Occupational Safety and Health Act of 1970, (29 USC §651 et seq.), hereinafter referred to as the Act, and involves the application of regulations adopted thereunder relating to noise exposure. In this proceeding the Secretary of Labor (complainant) seeks to affirm two items of a nonserious citation and a notification of proposed penalty, both of

which were issued on July 26, 1976, against the Dolese Company, (respondent) for its alleged failure to comply with the two regulations. The citation followed an inspection of respondent's work place located at 104 West Main in Edmond, Oklahoma, where respondent had two employees working at its batch plant, and charged that respondent failed to comply with the provisions of sections 29 CFR 1910.95(a) and 29 CFR 1910.95(b)(1).

The citation at item 1(a), charging respondent with violating Section 29 CFR 1910.95(a), reads as follows:

> "Protection against the effects of noise was not provided for employees exposed to sound levels which exceeded those listed in the Table G-16 of Subpart G of 29 CFR Part 1910: i.e., the employee that operated the crane, east of the batch plant, unloading and distributing rock and sand."

Item 1(b) of the citation, alleging that respondent violated Section 29 CFR 1910.95(b)(1), reads as follows:

> "Employee was subjected to sound levels exceeding those listed in Table G-16 of Subpart G of Section 29 CFR Part 1910, and feasible administrative or engineering controls were not utilized to reduce sound levels within those of the table; i.e., the employee that operated the crane, east of the batch plant, unloading and distributing rock and sand . . . "

The aforementioned standards are set forth in Title 29 of the Code of Federal Regulations as follows:

> "Section 1910.95, entitled Occupational Noise Exposure, reads in part as follows:
>
> (a) Protection against the effects of noise exposure shall be provided when the sound levels exceed those shown in Table G-16 when measured on the A scale of a standard sound level meter at slow response . . . .

(b)(1) "When employees are subjected to sound exceeding those listed in Table G-16, feasible administrative or engineering controls shall be utilized. If such controls fail to reduce sound levels within the levels of Table G-16, personal protective equipment shall be provided and used to reduce sound levels within the levels of the table."

* * * *

TABLE G-16 PERMISSIBLE NOISE EXPOSURES

| Duration per day, hours | Sound level dBA slow response |
|---|---|
| 8 | 90 |
| 6 | 92 |
| 4 | 95 |
| 3 | 97 |
| 2 | 100 |
| 1 1/2 | 102 |
| 1 | 105 |
| 1/2 | 110 |
| 1/4 or less | 115 |

After respondent submitted a timely notice of contest a complaint and answer were filed with the Review Commission and a hearing was held pursuant to notice in Oklahoma City, Oklahoma, on January 20, 1977, and April 29, 1977. Briefs have been submitted by both parties.

Subsequent to the hearings complainant moved to withdraw the $120 penalty proposed in connection with item 1(a) of the citation. The motion is hereby granted.

There are no jurisdictional matters in dispute inasmuch as the pleadings established that respondent is subject to the Act and that the Commission has jurisdiction over the parties and subject matter

herein. The issues to be determined are whether respondent violated occupational safety regulation 29 CFR 1910.95, as alleged in the citation and complaint, by failing to provide employees protection from the effects of noise levels in excess of those listed in Table G-16 and by failing to utilize feasible administrative or engineering controls to reduce the sound levels within the purview of Table G-16.

Complainant presented the testimony of two industrial hygienists, Mr. Wingo, and Dr. Anderson, who visited respondent's batch plant at Edmond, Oklahoma, on July 9th and 12th, 1976. A preliminary walk around was conducted on the 9th of July and a spot check was made of the noise levels in the cab of respondent's Manitowoc Crane, which indicated a possible exposure problem. On July 12th readings were taken by means of a Dupont audio dosimeter for a period of some seven and one-half hours, the measurement being taken near the ear of the crane operator. The instrument indicated an average of 100 decibels on an A weighted scale, with the readings ranging from 98 to 105 decibels. The only noise source was the crane operation, that is, the engine, gears, and winch mechanism. The operator was on duty for ten or more hours per day. He was positioned in the forward part of the crane and on the right side and was not wearing ear protective devices.

Mr. Henshaw, the crane operator, testified that he worked at the ready mix plant, charging the bins, picking up sand, unloading rock, and so forth. He testified that he could have asked for ear

plugs, stating that they were available at the Oklahoma City office of the company. Following the inspection he has worn ear plugs to protect against the excessive noise.

Dr. Anderson expressed the opinion that the Manitowoc Crane could have been maintained in a better fashion because he noticed several rattles and squeaks, as well as noisy gear levers. He felt that mechanical adjustments and the installation of isolators, foam installation and plywood interliners, could reduce the noise about five or ten decibels. He was unable to say how much better the maintenance or mechanical adjustments might reduce the noise levels.

Dr. Nelson, an engineer and consultant in the environmental field, including industrial hygiene, and an associate professor at the University of Oklahoma, testified that he was called by respondent to remedy the noise problem at the Edmond plant. He was at the Edmond site on January 26, 1977, and took some sound measurements for approximately one and a half or two hours, with a B and K sound level meter with an octave band analyzer. He observed the crane during various operations such as while the engine was idling, moving sand and gravel, lifting, turning and so forth. His readings were basically consistent with the OSHA measurements, ranging from 92 decibels while the engine was idling, up to 104 decibels during the lifting operations. The readings were taken with the door open between the engine and the cab and also while it was

closed. The average decibel level was found to be between 95 and 96. 1/ From his testing he concluded that the crane operator was exposed to noise levels greatly in excess of the standard in question.

Dr. Nelson testified that his investigation failed to reveal any type of retrofit package which could be utilized in connection with the 1951 Manitowoc Crane. It was his professional opinion that a minimum expenditure of $5800 would be required to provide the necessary reduction in the sound levels to meet the noise standard and then only if the crane cab remains closed at all times. He did not believe that any type of plywood interliners and a foam insulation in the cab would solve the problem, only a completely isolated cab would be feasible to insulate the cab from the engine noise and mechanical operation of the gears and levers. The $5800 figure included the complete removal of the cab and reconstruction of it with a metal enclosure, foam insulation, plywood lining, hydraulic controls, all of which would have to be used in connection with air conditioning and heating units. Considering the nominal costs of ear plugs, it was his opinion that all of the alterations necessary would be too expensive for the type of results which could be expected.

---

1/ When Dr. Nelson was at the site some plywood and rubberized material had been installed in the cab.

The ear plugs now worn by the crane operator (Willson Sound Ban) are, in Dr. Nelson's view an effective protective device and would lower the noise level well below 90 decibels. A sales manager of the Midwestern Engine and Equipment Company, Mr. Mowrey, testified that he was not aware of any type of sound proofing which could be purchased for this old model crane. Mr. Henry, also a sales representative with the Midwestern firm, testified that the market value of the 1951 Manitowoc Crane was about $1,000 to $1,500. It was his view, that the gears on the crane which cost between $650 and $750 each should be replaced because that would help reduce the noise. However, Mr. Mowrey advised that Manitowoc does not have any replacement gears for this particular model of crane.

Mr. Basolo, respondent's assistant director of safety, testified that he was not aware of any employee who had suffered any hearing loss, that is, none which had been documented by medical evidence. He advised that employees are told at their safety meetings that if they feel they need ear protection they can requisition the devices and that ear protection was offered to all employees. Mr. Basolo stated that American Optical muffs were formerly used but that the Willson Sound Ban[2/] type of plugs were now being used by their employees. He indicated that there has been no reluctance on the part of respondent's employees to wear the Willson plugs.

---

2/ The Willson ear plugs were purchased for $2.85 per unit according to Mr. Basolo.

Mr. Basolo further testified that a new crane would cost in the neighborhood of $150,000 to $200,000 and would of course be equipped with hydraulic controls and the cab would be completely sound proofed and air conditioned. He advised that at the Edmond plant it would not be administratively feasible to switch the two employees around because of the different skills involved and further because the batch man could not be used in the crane on account of back trouble which would prevent his pushing and pulling of the control levers in the crane.

Mr. Rutledge, a heavy equipment foreman for respondent, testified as to the action taken after the inspection was conducted in July, 1976. Ear plugs were distributed to the crane operators and they were given instructions as to greasing their equipment at the start of each work shift. Materials were purchased to install paneling and to insulate the cab.

After carefully considering all of the evidence in the record it is concluded that respondent violated the provision of Section 29 CFR 1910. 95(a) since it was established that the crane operator, Mr. Henshaw, was not wearing ear protection on the dates of the inspection. He was exposed to the noise generated by the crane engine and draw works which, according to measurements taken by the industrial hygienists, were considerably in excess of the 90 decibels figure permitted in Table G-16 for an eight hour day. The readings were not disputed.

Respondent's principal argument was that it did provide its employees with ear protection. This argument cannot be accepted. There were no ear plugs, muffs, or other protective devices available or provided at the batch plant in Edmond. Respondent has presented evidence, however, that ear protective devices were available at its general office in Oklahoma City to any employee upon request. Also, the availability of such devices was apparently made known to employees at their safety briefings. It should be pointed out, however, that the aforementioned Act, and regulations issued thereunder, require employers to furnish each of their employees a safe work place and that this responsibility cannot be left to the discretion of the workers. In view of the fact that the crane operator was subjected to excessive noise levels (98 to 105 decibels) for a period of approximately ten hours it must be found that respondent was in violation of Section 5(a)(2) of the Act by failing to comply with Section 29 CFR 1910.95(a).

The resolution of the remaining issue is more complex. Section 29 CFR 1910.95(b)(1) provides that where employees are subjected to noise in excess of the levels specified in Table G-16, the employer shall utilize feasible engineering or administrative controls. The burden of proving that engineering or administrative controls are feasible lies with complainant. It should be noted, however, that Congress did not provide any guidance as to what feasible means. The standard does not define it. The usually accepted meaning of feasible is practicable, suitable, or reasonable (see the New World Dictionary, Second College Edition).

The evidence in this case reveals that it is technically possible to lower the excessive noise in the cab of the crane to a level which would comply with Table G-16. By the expenditure of a minimum of $5800 the cab of the Manitowoc Crane could probably be removed, rebuilt, insulated, heated and air conditioned so that the operator would be protected against excessive noise. Respondent could also correct the situation by buying a new air conditioned crane by spending a sum of money ranging from $150,000 to $200,000 which would isolate the operator from the harmful noise. However, the question remains as to whether this would be economically feasible when the hearing of only one person is involved and where the use of inexpensive ear plugs would effectively protect him.

In the case of the Secretary v. Continental Can Company, OSAHRC 76/109/A2 (1976-1977) OSHD ¶21,009, the Commission in considering the matter of economic feasibility framed the issue as follows:

> "The basic controversy between the parties concerns whether the word 'feasible' as used in the standard should be interpreted to mean only 'technically possible' as labor contends, or whether it includes a component of economic feasibility as claimed by Continental."

The Commission ruled that the mere proof of the existence of technology capable of achieving a significant reduction in the noise levels is not sufficient to establish a violation of Section 29 CFR 1910.95(b)(1). Rather, to determine whether administrative controls are feasible, the

cost of such controls must be considered and weighed against the benefits which can be achieved. In Continental the Commission agreed that "feasible" as used in the noise regulation incorporated economic as well as technical factors and that the burden of establishing feasibility remained with the Secretary.

Also in Turner Co. v. Secretary of Labor, 561 F2d 82 (7th Cir. 1977), the Court adopted the logic in Continental Can stating:

> "We conclude that the standards should be interpreted to require those engineering and administrative controls which are economically as well as technically feasible. Controls may be economically feasible even though they are expensive and increase production costs . . . . But they will not be required without regard to the costs which must be incurred and the benefits they will achieve. In determining whether controls are economically feasible, all the relevant cost and benefit factors must be weighed."(Tr. 85)

In remanding the proceeding to the Commission the Court stated that the Commission must realistically consider the hazards presented by the excessive noise in Turner's work place and determine whether the health benefits to the employees who were equipped with personal protective equipment justify the cost of the engineering controls.

Here the Secretary argued that his burden should not go beyond a demonstration that technical measures exist whereby respondent can significantly lower the decibel level of the noise in the Manitowoc Crane and that respondent can afford the cost of implementing the controls.[3/]

---

3/ By stipulation it was admitted that the expenditure of $5800 would not work an economic hardship on respondent.

It was contended that the $5800 cost figure arrived at by Dr. Nelson is economically feasible and further that the cost might be much less by the use of a more efficient maintenance program, coupled with the installation of a plywood interliner and the foam insulation as suggested by Dr. Anderson. Complainant also argued that according to Dr. Anderson, who is not a professional engineer, the installation of plywood and foam insulation, in addition to the elimination of the rattles and squeaks could be effective in dealing with the noise problem (emphasis added).[4/]

Complainant has also contended that the batch man and the crane operator could switch job positions during the day, thereby reducing the exposure of the crane operator to the excessive noise.

The principal thrust of respondent's argument is that complainant has failed to show that administrative or engineering controls are feasible. Dr. Nelson testified in his opinion that anything less than the five measures set forth in his report (see respondent's exhibit R-4) and costing $5800 or more would not accomplish the necessary noise reduction. Respondent also questioned the conclusions reached by the OSHA industrial hygienist, Dr. Anderson, who felt that the noise

---

4/ In view of the greater experience and expertise in the noise abatement field, Dr. Nelson's opinion is considered to be more reliable. It is of interest to note that Dr. Anderson was a student of Dr. Nelson while studying at the University of Oklahoma.

could be controlled by the use of the plywood interliner and foam insulation.[5/] Respondent further contends that it would not be feasible to resort to controls costing four to five times the value of the crane itself. Respondent also points out that the expenditure of $5800, as recommended by Dr. Nelson to isolate the cab of the crane, valued at $1000 to $1500, must be weighed against the fact that only one employee will be exposed on that job site and when adequate protection can be achieved by inexpensive and comfortable ear plugs.

After carefully considering all of the testimony herein it is found that complainant has failed to establish the feasibility of engineering or administrative controls which might be instituted to comply with Section 29 CFR 1910.95(b)(1). Technologically the problem might be solved by all of the measures suggested by Dr. Nelson which would isolate the operator of the crane from the noise sources, or a new crane could be purchased for the sum of $150,000 to $200,000; however, it is concluded that the cost of isolating the cab would not be economically feasible when compared with the benefits to be achieved, to wit, the protection of one employee against a possible loss of hearing at some future date.

---

5/ These items alone would not work because the operator could not work with the doors closed because of the extreme heat in the summer months and the cold during the winter months. Dr. Nelson's testimony was convincing when he stated the noise in the cab could not be eliminated unless the cab was completely isolated from the engine, gears, draw works, and so forth.

It is also concluded that the complainant has not established that the use of feasible administrative controls would be effective. Dr. Nelson testified that dividing the work between the batch man and the crane operator would not be a practicable solution because of the difference in skills of the two employees. The same view was expressed by Mr. Basolo. He pointed out that the batch man was on light duty work because of a back problem and that he would be unable to pull the levers and controls in the crane.

Complainant has not presented any evidence as to the cost of implementing administrative controls such as would be required in the hiring and training of additional crane operators or other persons in order to split the hours in the noisy environment. Therefore, there would be no way to compare the costs of additional personnel or training with the benefits to be achieved. It is the present policy of respondent to hire fully experienced crane operators. It is here determined that economic feasibility is equally as important as engineering technology in considering the cost of the corrective measures against the health benefits to the affected employees.[6/] Accordingly, it is concluded that respondent did not fail to comply with Section 29 CFR 1910.95(b)(1).

---

6/ In weighing the relative costs against the benefits it should be noted that the Act is designed to protect employees from safety hazards in the work place. On the Edmond job site there is no evidence of any loss of hearing to date. The crane operator now wears ear plugs. It is concluded that a loss of hearing is not a serious safety hazard and that a hearing loss, if any, occurs gradually and over an extended period of exposure. It is dubious whether the expenditure of funds for engineering controls is warranted prior to the institution of a hearing conservation program to ascertain if any employees' hearing has been affected.

## FINDINGS AND CONCLUSIONS

Having considered the entire record it is concluded that a preponderance of the reliable, probative and credible evidence supports the following findings and conclusions:

1. At all times mentioned herein respondent, the Dolese Company, was and now is an employer within the meaning of Section 3(5) of the Act and the Commission has jurisdiction over the parties and subject matter herein.

2. Respondent, a corporation doing business in the State of Oklahoma, had two employees working at its batch plant in Edmond on the dates of the inspection, July 9th and 12th, 1976.

3. On the aforementioned dates respondent's crane operator, who was not wearing ear plugs, was exposed to noise levels in excess of the permissible decibel limits as set forth in Table G-16 and as a result thereof respondent failed to comply with Section 29 CFR 1910. 95(a).

4. The implementation of various engineering techniques costing $5800, or more, could result in a significant reduction in the noise levels in the cab of the Manitowoc Crane. However, the evidence failed to establish that engineering technology would be feasible, weighing the costs against the benefits to be achieved.

5. The evidence of record failed to establish the existence of feasible administrative controls which would reduce the noise levels to permissible limits as set forth in Table G-16.

6. Accordingly, it is concluded that respondent was not in violation of Section 29 CFR 1910.95(b)(1) on the dates of the inspection.

ORDER

Based upon the foregoing findings and conclusions and upon the entire record it is hereby ORDERED that:

1. Item 1(a) of citation 1, alleging a violation of Section 29 CFR 1910.95(a) be and the same is hereby affirmed and no penalty is assessed.

2. Item 1(b) of citation 1, alleging a violation of Section 29 CFR 1910.95(b)(1) be and the same is hereby vacated.

3. This proceeding be terminated.

ON FINAL HEARING

---

Robert A. Yetman for complainant

Robert J. Cooney for respondent

Local 2215, USWA, by Francis E. Reh, President

---

WEIL, J.:

This is an enforcement proceeding by the Secretary of Labor under the Occupational Safety and Health Act, 29 USC §§ 651-678. The Commission has jurisdiction because respondent is engaged in interstate commerce.[1]

I

BACKGROUND.

Carpenter is a manufacturer of specialty steels with plants in Reading, Pennsylvania, and Bridgeport, Connecticut, and other locations. Within each of the two plants mentioned, it uses straddle carriers to transport cargoes from location to location. At about 1:45 p.m. on March 9, 1978, in the Bridgepo c plant, Thomas Forgette, a crane repairman, was walking east inside Building 63, toward a large, open, vehicle door. His course was roughly parallel with the easterly wall of the building. At the same time "Hyster No. 5", carrying a cargo, was approaching the door on a course which would converge with Forgette's at an angle of about 30 degrees, at a point about 20 feet west of the door. (Exh. R. 44) The carrier driver's position was offset to a point in the left rear quadrant of its deck (Exh. R 42), so that in the right front quadrant the driver could not see the top of the head of a man 5 feet 8 inches tall (Forgette was 5 feet 6 (1104)) less than 7 feet 9 inches ahead of the vehicle. (Ex. R 38).

Caporaso, the driver, approaching the door and keeping a sharp lookout, could see Quinones, driving the "bobcat", a small front-end loader which cleaned up scrap, outside the door, preparing to enter. Caporaso stopped the carrier and waived Quinones in; whereupon Quinones passed, heading west, the right of the bobcat adjacent to the right of the carrier heading east. At this time Forgette,

walking east toward the door, was somewhere between the course of the carrier and the course of the bobcat, which had moved to a point west of where the carrier was stopped; it now pulled over close to the south wall of Building 63; and the bobcat also stopped. Caporaso, never seeing Forgette, started toward the door at a crawl. Quinones, who saw Forgette and saw the carrier starting to overtake him, sensed that an accident was imminent. He jumped on the bobcat, waved his arms and shouted "back." When Caporaso had moved about three feet he somehow sensed Quinones' warning. He stopped the carrier, backed up, climbed down from the cab on the left, saw a crowd at the right front quadrant of the carrier and finally learned what had happened. (236-243; Ex. R 33, 357-368; Ex. R. 36, Quinones' Statement to Compliance Officer 3/10/78; cf. Ex. R 35, Quinones' Statement to Carpenter Safety Engineer, 3/9/78.) The next day Forgette died in the hospital as the result of his injuries.

Neither side offered evidence or argument to show that the accident was the result of lack of skill or due care on the part of Caporaso; and there is no basis for such a finding.

## II

## THE INSPECTION, THE CITATION THE NOTICE OF CONTEST, AND THE PROCEEDING BEFORE THE COMMISSION.

Following the accident Carpenter's plant was inspected by the Secretary, who issued to Carpenter a citation charging Carpenter

with violating the General Duty Clause of the Act, 29 U.S.C. §654(a)(1), in that Carpenter had failed to furnish to its employees a place of employment "free from recognized hazards that are causing or are likely to cause death or serious physical harm to [its] employees...." As set forth in the amended complaint, the gravamen of the alleged violation was that Carpenter regularly operated through plant areas to which many employees had access in the course of their duties and in walking to and from their duty stations large, straddle-type cargo carriers which were so configured that the driver could not see an average-sized pedestrian who was less than about eight feet from the right front wheel, with other lesser blind spots in the other quadrants; that the drivers were not guided by walking flagmen; and that no automatic alarm warned pedestrians of the carriers' forward motion. Carpenter duly contested the citation, whereupon this enforcement proceeding resulted.

## III

## THE REQUIREMENTS FOR A *PRIMA FACIE* CASE UNDER THE GENERAL DUTY CLAUSE

A *prima facie* case for complaint under the General Duty Clause comprises the following elements: (1) that a hazard existed which could cause serious physical harm to employees; (2) that the hazard was "preventable", i.e., could be abated by specific feasible measures as proved by the Secretary; and (3) that it was "recognized", either by the industry of which the employer was a member or by the

employer itself. National Realty & Const. Co., Inc. v. Brennan, 489 F.2d 1257, 1265-1268 (CA DC c 1973); Vy Lactos Laboratories, Inc. v. Brennan, 494 F.2d 460 (CA 8 1974); Usery v. Marginette Cement Mfg. Co., 568 F.2d 902, 909-910 (CA 2 1977).

IV

THE CONTENTIONS OF THE PARTIES

The Secretary's claim may be summarized as follows. Operating Hyster No. 5 and similar carriers in areas of Carpenter's plants to which many employees had access and in which they had occasion to walk in the course of their work days constituted a serious hazard. Carpenter had express notice of the hazard from in-plant accidents in 1966 (Bridgeport) and 1975 (Reading). The hazard was preventable by a variety of feasible measures, i.e. adding mirrors to improve the driver's forward vision and an automatic alarm to warn pedestrians of the carrier's forward motion; and using a walking flag man to direct the driver. Secretary's brief, p. 7.

Carpenter's position may be summarized as follows. (a) The Secretary failed to prove a prima facie case. (i) The Secretary failed to prove that the alleged hazard was recognized by that sector of heavy industry which, like Carpenter, uses straddle couriers for in-plant cargo transport. (ii) The Secretary failed to prove that Carpenter itself had notice of the alleged hazard. (A) The Secretary has not shown that the prior accidents were substantially similar to the instant accident. (B) At the time of the 1966 accident the plant was being operated by a different corporation; and the Secretary has shown no facts which would make

reasonable to attribute to Carpenter notice of the acts or omissions of the other corporation. (C) The 1966 accident provided no notice of a General Duty Clause violation since that clause introduced in 1970 a statutory liability theretofore nonexistent. (iii) The Secretary has not proved feasible means of abatement. Front mirrors are ineffective; a sound device to warn of forward motion would give no more notice than the noise of the machine itself; and the flag man system is not feasible, since it is not economic to operate a 30-ton straddle carrier at walking speed and technological problems would interfere with receipt by the carrier driver of signals directed to him from the ground. (b) By way of affirmative defense, Carpenter pleads that the hazard was not caused by any breach of duty by Carpenter, but by an unpredictable and therefore unpreventable failure by an employee to comply with Carpenter's safety rules: the employee danger which here resulted in Forgette's death was caused not by Carpenter's operation of the carrier in the plant environment as it did, i.e., with blind spots, without a flag man and without an automatic forward motion alarm, but by the circumstance that Forgette was four feet outside of the pedestrian walkway, thus giving rise to "the defense of unpreventable misconduct by an employee" (Carpenter's brief, pp. 9, 2, 7).

V

THE ENVIRONMENTAL FACTOR OF THE HAZARD. THE BACKGROUND. THE AREA WHICH PRODUCED THE TRAFFIC PATTERN OF WHICH THE SECRETARY COMPLAINS.

Carpenter's Bridgeport facility is a large plant which worked 840 people in three shifts. To deliver supplies to the production

machines and carry away product Carpenter, on March 9, 1978, when the violation is alleged to have occurred, operated a fleet of seven straddle carriers, three on the morning shift, three on the afternoon shift and two on the night shift, with aggregagate travel at an annual rate of about 64,000 miles. Since 1970, when the Occupational Safety and Health Act became a law, carriers in the Bridgeport plant were involved in near misses but no pedestrian accident until Forgette was run down. Hyster No. 5, the carrier involved, was one of the seven referred to above. The area which produced the traffic pattern of which the Secretary complains lies between two doors in the extreme southeast corner of Building 63, leading to the plant gates, and a locker room about 110 feet to the west, containing 153 lockers and sanitary facilities. Of the two doors, one is a vehicle door 13 feet 11 inches wide, and the other, immediately adjacent to it, is an ordinary pedestrian door. The Forgette accident occurred at a point about 20 feet west of the doors and about 10 feet north of the south wall of Building 63. (Ex. R 44). Building 63 is about 180 feet north and south by about 56 feet east and west, housing 16 "abrasive cut-off machines." Immediately to the west is Building 10, which has a north wall which is an almost smooth projection of the north wall of Building 63. Building 10 is divided from Building 63 by a wall which runs about 160 feet south from this north wall, leaving an open passageway, about 20 feet wide, to Building 63. But Building 10 runs about 50 feet east and west by at least 250 feet north and south. Hence along its east wall it projects at least 70 feet beyond the passageway.

Its north wall is described above; and its west wall, roughly parallel with its east, runs north and south at least 250 feet. It contains at least seven "gantry grinders." Adjoining Building 10 to the west is an area bounded on the north by a further projection of the north wall of Buildings 63 and 10, with an east wall and a west wall each roughly 250 feet long, and with a north wall and a south wall roughly 26 feet long. The northerly portion, about 190 feet wide, is called Building 50 and contains the so-called "combination mill" and various electrical installations; while the southerly portion, called Building 9, contains the 153 lockers and the sanitary equipment.[2] (Ex. R 4)

Some of the shifts turned at 6:30 a.m., 2:30 p.m. and 10:30 p.m. and some later; and at about 1:45 p.m. on March 9, 1978, when Forgette was run down, he was the only one walking through Building 63. (1114) But that circumstance is far from decisive. If the environment between the locker room and the doors was such that the operation of Hyster No. 5 was dangerous to pedestrians, there was a hazard whether or not anyone was actually hit. National Realty, Supra, at p. 1267. During the three shift breaks, 150 to 170 people a day went to the locker room, including many from outside Buildings 63 and 10 (1105-1106; 1112; 298); and in the area between the locker room and the doors there was "a lot of pedestrian traffic." (304)

## VI

## THE HAZARDOUS INSTRUMENT. DIMENSIONS OF THE CARRIER AND ITS BUILT-IN BLIND SPOT. ROUTINE, INTENDED OPERATION OF THE CARRIER WITHIN THE PLANT ENVIRONMENT CONSTITUTED HAZARD.

The Secretary's effort to prove the hazardous nature of the instrumentality -- the carrier's built-in blind spot which largely

hid walking workmen from the view of the driver of Hyster No. 5 in forward motion (see Caporeso's testimony discussed above) met with very serious difficulties. (415-466)

Proof of the operation of one dangerous carrier would suffice to prove hazard; the Secretary had proved danger due to the blind spot only in respect of Hyster No. 5; from the time of the pretrial conference, two months before the trial, the catalogue dimensions of the 1972 30,000 pound capacity Hyster carrier were in evidence (Ex. R 6) -- and that was the model year of Hyster No. 5 -- and so the Secretary gave Lyons, his expert, "the assignment to draw diagrams based upon the 1972 Hyster." (434) "Unfortunately" counsel "did not then go back to Mr. Lyons to see if he had the 1972 data." In fact, Lyons did not have the 1972 data; and unfortunately Lyons thought that the 1972 dimensions so far as significant were the same as those of the 1975 model year, which Lyons had obtained through his own efforts. But the Secretary remained steadfast to his theory of the hazard -- that it must be based on the blind area of Hyster No. 5. And so, when it first appeared that Lyons' diagrams, then Exs. C 37A id. and C 37B id., were based on the dimensions of the 1975 catalogue, and Lyons was giving assurances that there were no significant differences, counsel for the Secretary wished only for the chance to show that this was so, and gratefully accepted the opportunity to offer what he hoped would be the necessary proof.[3] Accordingly I gave the Secretary an adjournment of the trial to enable Lyons to study the two sets of dimensions.

After comparison Lyons conceded that there was a significant difference: that the assumed driver's height of eye was six inches lower on the 1975 model than on the 1972, making the blind spot dimensions in his diagrams larger than they should have been. But Lyons was now sure that he had the data from which he could correct the diagrams to show the blind spots on Hyster No. 5; and over Carpenter's objection I gave the Secretary a second adjournment to enable Lyons to make the computations.

Carpenter then objected that there was a further error due to the circumstance that Lyons' diagrams, especially what was then Ex. 37B id., showed the engine enclosure on the center line of the carrier with the driver's position slightly offset to the left whereas a photograph of Hyster No. 5 clearly showed that the engine was well offset to the left, with the driver's position even further offset in that direction. (Ex. R10) Despite the Secretary's concession that Lyons' location of the cab constituted "poetic liscence" (438) I refused to strike Lyons' testimony at that point, reserving to Carpenter, however, leave to move to strike after the cross-examination of Lyons. But this was not the end. After correcting the blind spot dimensions for the height-of-eye error, counsel for the Secretary asked whether "there is anything other than the position of the operator which would vary the dimensions which you have just given on these diagrams?" Whereupon Lyons answered

> There is a difference between the purchase order and the company material furnished. Some of the dimensions were different. (454)

At pages 455-456 the following ensued:

> The Court: Well, you have a purchase order issued by Carpenter Technology?
>
> The Witness: That is correct.
>
> The Court: And you have a catalogue dimension?
>
> The Witness: Right.
>
> The Court: By the vendor. Now what are the dimensions of the vehicle as it existed on March 9, 1978?
>
> The Witness: I can't answer that.
>
> The Court: Which of those two sets of dimensions?
>
> The Witness: I can't answer that. I never measured that.

At that point I reversed my ruling which had permitted Lyons to correct his dimensions based on calculations taking into consideration the difference between the assumed height of eye of the operator in the 1972 specifications as opposed to those for 1975; again over objection, I persuaded Carpenter to arrange to make Hyster No. 5 available for measurements by Lyons; and I granted a third adjournment to the Secretary to enable this to be done. (415-466)

The next day, based on this preparation, Lyons was able to give the following dimensions. Hyster No. 5 is 15 feet 11 inches long by 7 feet 9 inches wide. (Ex. R42). It has a deck 6 feet 9 inches high (486) and a driver's height of eye measured at 11 feet. (477; 487) Resting on the deck is an engine enclosure, and the cab (Exs. R8; R9; R38) which are well offset to the left (Exs. R42; R10).

The aggregate of these factors created two right triangles of driver non-vision ahead. In each triangle, the hypotenuse

would be a projection of the driver's line of sight. In the right front quadrant the line of sight would touch the front of the engine enclosure and run to the nearest visible point in the ground ahead. Measuring back from that point to the right angle, where a perpendicular touching the right front tire would have its base on the ground, the longer of the two sides adjacent to the right angle would have a length of 28 feet. The shorter side adjacent to the right angle -- the perpendicular -- would have an upper limit at the point where it intersects the line of sight, which projects on to become the hypotenuse. Moving a man 5 feet 8 inches tall forward within the triangle until the top of his head intersects the hypotenuse and begins to become visible to the driver, he would be 7 feet 9 inches forward of the right front wheel. In the left front quadrant the line of sight would run to the left of the engine enclosure touching the front of the deck and run to the nearest visible point in the ground ahead. Measuring back from that nearest point to the right angle, where a perpendicular touching the left front tire would have its base on the ground, the longer of the two sides adjacent to the right angle would have a length of 13 feet 11 inches. The shorter side adjacent to the right angle -- the perpendicular -- would have an upper limit at the point where it intersects the line of sight, which projects on to become the hypotenuse. Moving a man 5 feet 8 inches tall forward within the triangle until the top of his head intersects the hypotenuse and begins to become visible to the driver, he would be 2 feet 2 inches forward to the

left front wheel. In the other directions, the dimensions of the blind spots measured along the ground were as follows: with the operator looking out at an angle of 90 degrees from the fore-and-aft axis of the carrier, on the right, 6 feet 9 inches and on the left 2 feet; and looking aft, 5 feet 7 inches. (479; 480; 483; 490; Exs. R38; R42).

To be sure, Hyster No. 5 made a loud noise from its diesel engine and its massive chain drive; and to emphasize its visibility it was painted a bright yellow and on top of the cab it had a rotating red strobe light. But the near misses and the fatal accident occurred although Carpenter's well-trained drivers kept carrier speeds to five miles an hour or less in the buildings (299-303). Clearly, the operation of Hyster No. 5 in the plant on March 9, 1978, exposed employees to the hazard of serious physical injury or death.

## VII

## THE AFFIRMATIVE DEFENSE OF ISOLATED, UNPREDICTABLE OCCURRENCE DUE TO EMPLOYEE RULE VIOLATION WAS NOT MADE OUT.

Carpenter puts misplaced reliance on its affirmative defense to the effect that the cause of the accident was Forgette's isolated, unpredictable and therefore unpreventable failure to comply with a rule which required him, in walking toward the doors, to keep within the pedestrian walkway. The rule on which Carpenter relies, Ex. R3, contains no such requirement. The rule reminds employees of the longstanding requirement that in general they wear hard hats, safety glasses and safety shoes throughout the plant and warns that

this will be strictly enforced. In pertinent part the rule then provides:

> In order to better protect employees walking between the guardhouse and the locker rooms, white safety lanes have been painted showing the approved routes to the melt shop, anneal, billet prep, combination mill and blooming mill locker rooms. Employees walking in these safety lanes at change of shifts will not be required to wear safety equipment. Employees using other routes and not wearing safety protection will be subject to safety violations. (Emphasis added. For the full text of the quoted rule, see Footnote 4.)

Forgette was not on his way from the gate to his locker to pick up his safety equipment, nor was he homeward bound to the gate after putting aside his safety equipment. On the contrary, he had carried a small motor to the combination mill in Building 50 and was on his way back to his duty station. (1112-1113; 1241-1242). To show that the rule required Forgette to walk within the lane, the burden was on Carpenter to prove by way of affirmative defense that Forgette was moving to or from his locker, without his safety equipment. PBR, Inc. v. Secretary of Labor, ___F.2d___ (CA1 March 11, 1981, No. 80-1376, slip opinion, p. 8); Secretary v. B-G Management, Inc., 4 BNA 1282 (1976) and cases collected at page 1283; Secretary v. Jensen Const. Co., 6 BNA 1070, 1071 (1977). That burden Carpenter made no effort to meet. See 1659-1660 and Carpenter's proposed finding No. 317.

## VIII

## THE MEANS OF PREVENTION PROPOSED BY THE SECRETARY WERE NOT PROVED TO BE EFFECTIVE.

As indicated above, the Secretary sought to prove that the hazard of the carrier's forward motion was preventable by three separate measures: a front-vision mirror showing an area in the otherwise blind right front quadrant of Hyster No. 5 nearer to the carrier than the place where a man 5 feet 8 inches tall would come within the operator's unaided line of sight; a walking flag man to guide the driver; and a continuous alarm sounding automatically when the carrier moved ahead. None of these measures was shown to be feasible.

### A

There were vague statements by Lyons about the effects of forward vision mirrors on miscellaneous carriers, none of which was shown to be a 1972 model Hyster of 30,000 pounds capacity.[5] These were of little value since there was no proof as to the dimensions of the various carriers: no proof as to the respective blind spots without mirrors, and no proof as to the mirrors' effects, if any; indeed, no facts from which could be derived a method for relating those statements to the issue as to whether mirrors would render preventable the blind spot in the right front quadrant of Hyster No. 5. There was however a notable exception. As the result of driver pressure immediately following the Forgette incident Carpenter had installed a convex mirror over the right front corner of Hyster No. 5 (Exs. C4; R12); and with that fact as a basis Lyons was asked to give evidence about what the mirror showed the driver, which evidence, in its setting, was as follows.

Lyons had given the results of his actual measurements as to where the line of sight of the driver of Hyster No. 5 touched the ground (1) over the right front quadrant, (2) projected out to the right of the driver's position at 90 degrees from the fore-and-aft axis of the carrier, (3) to the rear, (4) projected to the left of the driver's position at 90 degrees, and (5) over the left front quadrant. Also, he had measured forward from the carrier to the nearest point on the ground where a man 5 feet 8 inches tall could be standing with the top of his head just breaking the driver's line of sight in the right front quadrant and then in the left front quadrant. Referring to Lyons' testimony as to the nearest points out at 90 degrees at which the driver's line of sight would touch the ground, Lyons was questioned as follows:

> The Court: These are ground dimensions?
>
> The Witness: Yes, sir.
>
> The Court: Did you make any measurements to show at what point a man would become visible?
>
> The Witness: No, sir. Mainly, -- may I answer?
>
> The Court: Well, you say no. This is your answer.
>
> [By Mr. Yetman]
>
> Q. Mr. Lyons, may I ask why?
>
> A. Mainly because I thought my assignment was restricted to what was shown on the diagram, and [on] the diagram I only show the person forward of the vehicle.
>
> (483-484)

* * *

The Court: When the driver is looking down into the mirror from the normal driving position, what does the mirror show him, if you know? (492)

* * *

A [Lyons]: Yes, sir. On the vehicle from the driver's position it gave a view of the right front wheel going vertically down from the mirror itself, limited in scope approximately about a foot and a half to a two foot view at the ground.

The Court: When you say, a foot and a half view at the ground, do you mean to convey by that a foot forward of the forward edge of the wheel?

The Witness: Yes, sir. (493-494)

Somewhat later, on cross-examination Lyons testified further on the point as follows:

Q. Now, the mirror that you talked about being installed on the right front corner of the Hyster vehicle, if it was properly aligned it would show the driver an area from one to two feet in front of the right front tire, is that correct?

A. That was a dimension that I mentioned, sir.

Q. Well, is that correct?

A. Yes.

Q. Is that right?

A. It can be adjusted that way.

Q. Is that the maximum distance that the mirror can be adjusted for a driver to see the area, the right front area of the right front wheel?

A. No. It could be adjusted, the mirror that I saw in that vehicle yesterday could have been adjusted to give a greater field of vision to the driver in the front of the vehicle.

Q. Could you tell me based upon your examination of the vehicle what the dimensions would be?

A. Sir, that wasn't included, as I didn't want to veer from our instructions from the Court which was only to take measurements of the truck.

Q. Your answer is that you can't tell me, then, is that correct?

A. Sir, I think you are being unfair.

The Court: Just a minute, gentlemen. I don't want you to get into a debate. Now, is there a question before the witness?

(The reporter read the previous question.)

The Court: Next question.

Mr. Cooney: Your Honor, Mr. Lyons was permitted on direct examination to testify at some length about the mirrors and what they would show and what they wouldn't show, the front view mirror and the mirror that he saw on the vehicle and the other mirror that he described. I am asking him whether he could tell me what the maximum distance or range would be for that mirror on that vehicle.

The Court: Well --

Mr. Cooney: I am entitled to have an answer to it.

The Court: Did you tell us a moment ago, Mr. Lyons, that you did not investigate this question when you went to the plant yesterday because you understood that you were under instructions from me to simply take measurements in order to correct a situation which I mentioned during the trial?

The Witness: Yes, sir. (568-570)

A little later in the cross-examination counsel referred back to Lyons' opinion that the mirror on Hyster No. 5 could be adjusted to give greater forward vision than the one and a half to two feet which Lyons had estimated from the position in which he had seen the mirror. Mr. Cooney's question was "what the slightly increased range of visibility would be for that mirror if it was aligned in the way you indicated", to which Lyons answered:

> "Conservatively I think you could possibly get in front of the wheel a horizontal distance of about four or five feet." (572-573)

But what was to come out before the cross-examination was over showed that Lyons' most important testimony, admittedly incorrect, was of little help in determining the issue as to the value of the mirror in establishing that the hazard was preventable. Lyons had not refrained from measuring the area shown by the mirror: on the contrary, he admitted that he measured and found its depth to be only 6 inches from the front of the right front tire. (626-627; Ex. 38) And as to his attempted explanation that he had refrained from making the measurement because of his understanding of my instructions, his admission was as follows:

By Mr. Cooney

> ...when I asked you earlier on cross-examination you told me that you did not take measurements concerning the distances in relation to the mirror and yourself and the driver because that was beyond the scope of his Honor's instructions, is that correct?

A. That is correct.

Q. So when you said that, your answer was not correct?

A. Well, I agree with you, sir.

With respect to Lyons' testimony several considerations seem clear. Although I gave no such instructions (see 466-472), I see no reason to disbelieve him when he first said that he thought that they limited him in the measurements he might make. He had made no claim that side view mirrors would show the Hyster No. 5 hazard to be preventable, hence no side measurement would endanger his theory; and there is no evidence that he actually made side measurements to show where the hypothetical man would come into view. But the effect on forward vision was the crux of his position on mirrors.

His measurement would destroy his theory and he wanted to keep it out of the record: instead, he wanted the evidence as to the mirror's effect to be limited to his approximations, i.e., the one given to me that as it was angled on December 4, 1978, the mirror would project the driver's vision out up to two feet from the right front wheel, and the one given to Mr. Cooney, that as the mirror could be adjusted for optimum effect, the projection would be up to five feet. In order to bring that about he made two untrue statements: that according to his knowledge the mirror gave a view forward of the right front wheel extending about a foot and a half to two feet (492-493); and that he made no measurement of the area of view afforded of the mirror. Indeed, the last mentioned misstatement was made twice: the first time at 569 when, as quoted above, he explained that he couldn't give the distance revealed by the mirror because "that wasn't included and I didn't want to veer from our instructions of the Court which was only to take measurements of the truck", and the second time at 569-570 when Mr. Cooney was demanding a further answer to the question whether Lyons could tell him what the distance asked was that was revealed

by the mirror -- "I am asking him whether he could tell me what the maximum distance or range would be for that mirror on that vehicle." At that point, again as quoted above, my question and Lyons' answer were as follows:

> The Court: Did you tell us a moment ago, Mr. Lyons, that you did not investigate this question when you went to the plant yesterday because you understood you were under instructions from me simply to make measurements in order to correct a situation which I had mentioned at the trial?
>
> The Witness: Yes, sir.

In cases heard by a trial judge in which the evidence of an expert witness runs into difficulty in gaining acceptance it is often because he has failed to demonstrate that his opinion is the one which is entitled to be projected from a hypothetical question based on the facts of record or directly from the facts themselves. Rules of Evidence, 702. But the expert may also give his opinion without disclosure of his facts or data prior to cross-examination, id., 705. Here the opinion is challenged on cross-examination by an attack on the veracity of the expert in reporting the factual data; and upon that attack it seems clear that the problems arise not from momentary confusion, which a witness may spontaneously recognize, and explain, but from a repeated attempt to shore up unprepared testimony at the expense of the facts.

Finally, in the earlier portion of his evidence Lyons' claim that a front view mirror would prevent the exposure of Carpenter employees to the hazard of operating Hyster No. 5 in the plant is solidly refuted by the testimony of Caporaso, who was driving

the carrier when it struck Forgette and who was familiar with the front view mirror installed, and of Compliance Officer Foley, who, the day after the accident, climbed into the seat in the cab of Hyster No. 5 to determine what the driver could see in the mirror. Thus Caporaso testified as follows.

> The Court: Tell us what the mirror shows.
>
> The Witness: The immediate area in front of the carrier. The right front tire and part of the load is visible, depending on the way, you know, the individual driver will angle the mirror.
>
> The Court: Well, with the mirror in place, would it be possible actually to see the surface of the tire itself?
>
> The Witness: Yes, sir.
>
> * * *
>
> [By Mr. Cooney]
>
> Based upon my conversation at the Carpenter Technology plant about this accident, didn't you tell me that the mirror located where it was located on Hyster No. 5 on March 10, I guess, or after the accident, would not in your view have prevented this accident?
>
> A: In my view it wouldn't have.
>
> (278-279)

In more general terms, Caporaso testified as follows when I recalled him as a witness at the close of the trial.

> Mr. Caporaso, you were a regular Straddle Truck Driver on March 9, 1978?
>
> The Witness: Yes, I am.
>
> The Court: Okay. Have you been a regular Straddle Truck Driver ever since?

The Witness: Yes, sir.

The Court: I see. Now, immediately after the accident, was a mirror placed on each of the Staaddle Carriers?

The Witness: Yes, there was.

The Court: Okay. Are they on there now?

The Witness: Yes.

The Court: Okay. Now, I want you to compare the operation of a Straddle Carrier prior to the installation of the mirrors, with the operation of a Straddle Carrier after the installation of a mirror, and tell us the difference?

Mr. Cooney: For the record, your Honor, I'm going to object to the Court asking this witness questions for the reasons I stated earlier.

The Court: Yes. Your objection is noted and overruled.

Mr. Cooney: Thank you.

The Witness: Well, the operation, to my estimate is basically, the same with them on or with them off. Primarily, the mirror, to the way the drivers and myself feel, it gives us a better visibility of the right front, but it seems to be, primarily in that area for the lesser wear and tear on the equipment itself, as we are negotiating a turn over the load we can judge or help to aid us, it can judge or help aid us in negotiating better our lefthand turns and cutting down the effect of the tire hitting a load and ripping the tire. Now as far as the visibility effect on the front, directly down, there is visibility there now that we never had before as to the immediate area in front of the tire on that right fron[t] side.

The Court: And just expound, if you will, on the effect of the mirror or the changes created by the mirror with respect to a pedestrian in front of the righthand corner of the vehicle?

The Witness: Depending upon the way the mirror is angled by each individual driver, and depending upon how much an area is visible, either directly in front of the right tire, in front of the right center of the Carrier -- excuse me, the left center of the Carrier and also the right corner of the tire -- In other words, you can have a larger area, depending upon the way you angle the mirrors as to the area you have in front of the machine itself, and it is also, basically, individual preference. Some of the drivers have asked to have the poles, the extent as to which the mirrors are attached, bend further forward to give a different depth to the individual driver and the other drivers don't want them moved and have them back in just about a 90 degree position.

The Court: Well, I don't think you have quite answered my question. Now, I would like to have you comment, if you will, as to any difference which you have observed with respect to the visibility of the driver of the pedestrian in the righthand forward quadrant of the vehicle when it is proceeding forward?

The Witness: I don't think it does aid you, does help you in that area.

(1661-1663)

Referring to Schuler, Carpenter's Safety Manager, who assisted Foley in seeking to determine the effect of the mirror, Foley testified as follows:

The Court: Before we leave this subject of the mirror, may I just interrupt for a few moments. I want to ask one or two questions. You got up into the driver's seat of this vehicle?

The Witness: Yes, your Honor.

The Court: Did you look in that mirror?

The Witness: Yes, your Honor.

The Court: All right. Now, do you recall what you saw in that mirror?

The Witness: I could see Mr. Schuler because he was in front of it for me. I asked him to stand in front of the wheel for me.

The Court: Do you know how far in front of the wheel he was when you could see him?

The Witness: He was right next to the wheel, your Honor.

The Court: He was right next to it?

The Witness: Right. Right next to the wheel.

[By Mr. Cooney]

Q: Is it true, Mr. Foley, except for showing the area directly in front of the right front wheel it does not show any area in front of the straddle carrier?

A: Correct, the way the mirror was positioned. That is correct.

(162-163)

Upon all of the proof I cannot find that the Secretary proved that the hazard of operating Hyster No. 5 in the Carpenter plant on March 9, 1978, was preventable. I turn, then, to the Secretary's claims that it was preventable by the use of a flag man, or through the operation of an automatic alarm.

B

The Secretary's case that the hazard was preventable through the use of a flag man and an automatic forward motion alarm was put in through Lyons.

As to the flag man his proposal was in two parts. According to Lyons, at the points where a carrier delivers stock and/or picks up product, the driver acts under the direction of a "stocker". These are the points of pedestrian traffic concentration and hence of carrier hazard. On reaching these areas the carrier driver can put himself under the control of the stocker, who, via two-way radio, would talk him in and talk him out. (537) Elsewhere the driver could be guided by a walking flag man either via two-way radio or through hand signals or by flashlight. The flag man could be stationed to one side of the carrier, about four to six feet ahead of the point where the head of a man 5 feet 8 inches tall would break the line of sight of the driver. (538; 610-611) As examples of the flag-man operation, Lyons cited the man who had to walk with a lantern ahead of the early automobile to avoid the horses being scared by its approach, the "crane follower", and the "placer" who would guide the driver backing up to unload at a construction site. (537-538)

With respect to a forward motion alarm Lyons likewise had two suggestions. The first was a device attached to one of the carrier's wheel hubs, arranged so that notches in a ring attached to the hub would cause a hammer to strike a gong, with a centrifugal governor which would hold the hammer away from the gong as long as a selected rate of speed was maintained. Under Lyons' second suggestion, the

hammer would be driven by an electric motor, with optional wiring which would prevent the carrier from moving forward until the gong circuit was closed, and which could provide an override by which the driver might turn off the alarm (538-541).

There was little attempt by Lyons to relate these suggestions to the actual conditions which resulted from the operation of Hyster No. 5 in the Building 63 -- Building 10 -- Building 9 -- Building 50 area between the doors and the locker room. There was no report by Lyons on the size, shape, contents, personnel and traffic patterns within the buildings and no studies as to what kind of flag man system and what kind of forward motion alarm were needed and would bring about what results -- nothing to indicate whether and to what extent Lyons had informed himself on these points as a basis for his opinions. He was never commissioned to do these studies; he never got inside the plant; he was never given the catalogue dimensions of the 1972 30,000 pound carrier or any other pertinent information. (610; 623-625; 657-658) He never measured or photographed the six carriers which he studied in preparation for his testimony, material which could be highly relevant to his opinion as to the need for and the feasibility of a flag man system. He never showed whether within the Carpenter plant there was any such person as a "stocker", with functions such as Lyons attributed to him. He never showed where a flag man could be stationed so that, despite the mammoth blind areas of Hyster No. 5 he could simultaneously see pedestrians in time to give effective warning to the driver and be able to

make flashlight or hand signals which the driver could see and read. He never reported on any facility where a flag man system was in operation except for several small boatyards which used carriers on "a back and forth operation on a track or runway" (561) which boatyards, as above shown, almost certainly used Travelifts, which have an entirely different design and are completely dissimilar in the features which limit the operator's ability to see pedestrians and to see signals from a flag man, which yards worked four or five men each, as contrasted with the group of 150 to 170 workers which daily traversed the Carpenter area here under consideration.

The problem of relating Lyons' general suggestion with respect to the audible forward motion alarm to actual conditions in the Carpenter plant was at least equally difficult and as completely unsolved. The engine sounds of Hyster No. 5 seemed not to warn Forgette, a few feet away, as it went through its most noisy phase -- picking up cargo (239-242; 263; 1580); and when the loading operation was completed and the carrier was moving forward at a crawl, Caporaso could not hear Quinones shouting to him at the top of his lungs. On the other hand Lyons recognized that it was important not to make the alarm so loud that it would distract the driver. (540) But he made no tests to measure the ambient noise over which an effective horn or gong would have to be heard, or the intensity and pitch of a signal which would warn pedestrians but leave the driver able to operate safely.

Lyons' position was directly disputed by Carpenter's witnesses, Houser and Dunham. (1581-1582; 1501; 1503-1506) Houser is a Lehigh B.S. in Mechanical Engineering, a safety engineer licensed by the State of California, and a past Chairman of the General Safety Committee of the American Iron & Steel Institute. He is coordinator of safety at all Carpenter plants; he visits the Bridgeport facility at least once a month; and he personally took part in the investigation of the Forgette accident. (1566-1581) Dunham has been an engineer licensed by the State of Pennsylvania since 1948. He is a certified safety professional and an independent safety consultant who spends about 25 percent of his time on problems related to material handling. (1477-1484) Engaged by Carpenter to testify in this case, he studied the area of the accident and Hyster No. 5. (1485-1491; 1495; 1500-1501) Based on their better opportunity for studying the facts, I could refuse to find that the Secretary has proved by a fair preponderance of the evidence that the hazard was preventable, despite the circumstance that I rejected their view that the operation of Hyster No. 5 on March 9, 1978, created no hazard. But the real issue here is different. The threshold question is whether Lyons' evidence met the Secretary's burden to prove "the feasibility and likely utility of particular measures" -- "to specify the particular steps a cited employer should have taken to avoid citation, and to demonstrate the feasibility and likely utility of these measures." National Realty, supra, 489 F.2d pp. 1267, 1268. To meet that requirement something more was required than

putting Lyons on the stand and having him testify that in general, safety conditions attendant upon operating a carrier in a steel mill would be improved if a flag man system was implemented and an automatic forward motion alarm were added.[6] Since the Secretary failed to fulfill the requirement that he prove the particular steps pertaining to driver guidance by a flag man or "stocker" and pertaining to an automatic forward motion alarm, which Carpenter could have taken to avoid citation, I find against the Secretary on those points.

IX

Since I do not find the hazard preventable, I do not reach the issue as to whether the hazard was recognized, the point found dispositive by Judge Carlson in Secretary of Labor v. Lytton Systems, Inc., No. 76-900 (April 4, 1977; review directed May 4, 1977).

Accordingly the citation is vacated and the amended complaint is dismissed with prejudice.

## NOTES

1. See pretrial order, November 17, 1978, ¶ 1.3.

2. Thus Buildings 9 and 50, like Buildings 10 and 63, are roughly rectangular.

3. The following occurred at 415-416:

> Mr. Cooney: Well you Honor, I am going to object unless he is using that data sheet. I think a proper foundation has to be laid to show that the data sheet is the same as the 1972 Hyster model that is involved in this incident.
>
> The Court: I think you are absolutely correct.
>
> Mr. Yetman: If only I had a chance to do that.
>
> Mr. Cooney: I think he would like a chance to do that.
>
> The Court: I think now is your chance.
>
> Mr. Cooney: Thank you. Now is your chance.
>
> Mr. Yetman: Thank you, Mr. Cooney.

4. The full text of the rule is as follows.

> The Carpenter Steel Division has long since adopted a safety program whereby all employees shall wear safety glasses, hard hats and safety shoes. Over the past several months many employees have neglected to wear the mandatory personnel safety equipment. Effective July 15, 1974, all employees are hereby given notice that the safety program will be strictly enforced. Violators will be subject to the normal disciplinary procedure.
>
> In order to better protect employees walking between the guardhouse and the locker rooms, white safety lanes have been painted showing the approved routes to the melt shop, anneal, billet prep, combination mill and blooming mill locker rooms. Employees walking in these safety lanes at change of shifts will not be required to wear safety equipment. Employees using other routes and not wearing safety protection will be subject to safety violations.

> As you know, the company is required by the Occupational Safety and Health Act to enforce a safety program including safety glasses, hard hats and safety shoes.
>
> We ask your cooperation in this program to reduce serious injuries.

5. Lyons "was educated as a textile chemist in colors and dies [sic] at Lowell Textile Institute"; and in addition he took miscellaneous engineering and safety courses; but he holds no degree from any recognized college and no engineering or design degree. (407-408; 546) At the time of the trial he was Manager of the Safety Engineering Department of Gillette, which operated no straddle carriers (398; 546) Lyons' employment in a steel mill which operated straddle carriers was at Youngstown Sheet & Tube, 1952-1958. He described his work at Youngstown as "supervisor of methods in the handling of straddle carriers and the design and development and use of various types of carriers..." (502); but this broad spectrum of responsibilities lasted less than a year. To be sure, Youngstown brought in three 10,000-pound capacity Clark carriers which were modified with mirrors and two-way radios to meet unstated conditions, with unstated results. But after a trial period of eight or nine months the carriers were discarded in favor of trailers. (405; 547) Since Lyons' connection with Youngstown he has never seen a Clark carrier with a front view mirror. (549-550)

After the completion of his work for Youngstown on carriers (503), while Youngstown was on strike in 1953, Lyons worked on carrier safety for Timkin Roller Bearing, which operated five or six carriers which were accidentally hitting stationary objects. Lyons' group studied "the use of lights, mirrors, audible devices, and shields, and the general plant layout and the area of travel of these vehicles", seeking to "develop corrective action that could be used in the operation of vehicles to eliminate incidents of damage to the property of others and to vehicles, to pedestrians, and to other motor vehicles." But Lyons did not remember the make or makes of the Timkin carriers and he did not specify the dimensions of any blind spots or the characteristics of the environment. (502-505; 554-555)

Lyons testified to three random incidents from which he claimed to have gleaned information relevant herein. Despite his evidence that Youngstown's carrier equipment was made by Clark, Lyons testified that in 1953 he saw at the Youngstown plant a Hyster equipped with three front view mirrors. (640-641) While on a fishing trip to Maine during the period 1970-1975, Lyons saw a lumber company carrier equipped with two-way radio. And in 1976, near Mason, Ohio, he saw a carrier equipped with two or three front view mirrors and with a radio which might have been two way. At first he testified that the latter two carriers were Hysters; but upon being pressed he could not be sure. (642-646)

(5 continued)

To prepare himself to testify in this case Lyons looked at six carriers but he was not really sure that any were Hysters. At first he identified as Hysters one with no mirrors and no radio in a small North Shore boatyard (550-551) and two, inert, in the junk pile of a Maine lumber camp. But he admitted that he wasn't really sure about the make of the two in the junk pile (621-623); and he gave testimony which at three points was inconsistent with the North Shore boatyard carrier being a Hyster. After identifying carriers which he looked at in a boatyard in Plymouth and in two boatyards in Duxbury as Travelifts (553; 556; 559), he testified that prior to measuring Hyster No. 5, the only carriers which he looked at were four Travelifts (564); that prior to Hyster No. 5 the only Hysters he saw during such preparation were the two in the junk pile (621-622); and that for the purposes of his preparation he couldn't locate a single operational Hyster. (623) The layout of a Travelift is entirely different from that of Hyster No. 5, giving rise to completely dissimilar problems of operator vision which Lyons made no attempt to reconcile. (560-562; 564-568; 584-604. Note Ex. R37A, at page 2 of Ex. R37 id., marked as part of Carpenter's offer of proof, 602-604)

6. "Opinion evidence without any support in the demonstration and physical facts, is not substantial evidence. Opinion evidence is only as good as the facts upon which it is based." State of Washington v. United States, 214 F.2d 33, 43 (CA 9 1954)

Even where such opinions are entitled to some weight, they have "no such conclusive force that there is error of law in refusing to follow them." Sartor v. Arkansas Gas Corp., 321 U.S. 620, 627 (1944). The Court continued:

> "* * This is true of opinion evidence generally, whether addressed to a jury or to a judge or to a statutory board." Dayton Power & Light Co. v. Public Utilities Commission, 292 U.S. 290, 299. Cf. Halliday v. United States, 315 U.S. 94, 97; Forsyth v. Doolittle, 120 U.S. 73, 77; McGowan v. American Pressed Tan Bark Co., 121 U.S. 575, 609; Quock Ting v. United States, 140 U.S. 417, 420; Head v. Hargrave, 105 U.S. 45, 50; Union Insurance Co. v. Smith, 124 U.S. 405, 423. The rule has been stated "that if the court admits the testimony, then it is for the jury to decide whether any, and if any what, weight is to be given to the testimony." Spring Co. v. Edgar, 99 U.S. 645, 658. "...the jury, even if such testimony be uncontradicted, may exercise their independent judgment." The Conqueror, 166 U.S. 110, 131. (id., 627-628)

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>SOUTHWEST FOREST INDUSTRIES INC.,<br><br>Respondent. | OSHRC Docket No. 78-3976 |

ORDER OF REMAND

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

On December 17, 1982, the Commission issued its decision in Sun Ship, Inc., OSHRC Docket No. 16118. In accordance with the decision of the U.S. Supreme Court in American Textile Manufacturing Institute, Inc. v. Donovan, 101 S.Ct. 2478 (1981) ("ATMI"), the Commission held that "feasible" under the occupational noise standard means achievable. The Commission overruled the cost-benefit test of feasibility previously set forth in Continental Can Co., 76 OSAHRC 109/A2, 4 BNA OSHC 1541, 1976-77 CCH OSHD ¶ 21,009 (No. 3973, 1976), appeal withdrawn, No. 76-3229 (9th Cir. Apr. 26, 1977), and substituted a test consistent with ATMI.

In view of this intervening change in law, the judge's decision with respect to the alleged violation of section 1910.95(b)(1) is vacated. The case is remanded for further proceedings, including evidentiary submissions, so that the interrelated issues of technological and economic feasibility can be reconsidered in light of the test of feasibility established by Sun Ship, Inc.[1/]

SO ORDERED

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: DEC 23 1982

---

1/ Chairman Rowland dissents. He would not remand the case for further proceedings. Consistent with his dissenting opinion in Sun Ship, he concludes that the requirement in section 1910.95(b)(1) that feasible administrative or engineering controls be utilized is invalid.

UNITED STATES OF AMERICA

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>SOUTHWEST FOREST INDUSTRIES, INC.,<br>Respondent. | OSHRC DOCKET NO. 78-3976 |

## DECISION AND ORDER

Appearances:

Allen L. Prince, Douglas N. White, and Gail M. Dickenson, Esquires, of Dallas, Texas, for the complainant.

Douglas B. M. Ehlke, Esq., of Federal Way, Washington, for the respondent.

## STATEMENT OF THE CASE

BLYTHE, Judge:

This is a noise exposure case in which the Secretary of Labor ("the Secretary") alleges that the respondent, Southwest Forest Industries, Inc. ("Southwest") violated §5(a)(2)[1] of the Act and health standards codified at 29

---

[1] The Occupational Safety and Health Act of 1970, 29 U.S.C. §651, et seq.

CFR 1910.95(a) and (b)(1)[2] by exposing employees to sound levels exceeding permissible limits and failing to use feasible administrative or engineering controls to reduce exposure of employees to excessive sound levels.

---

[2] The cited standards provide:

29 CFR 1910.95(a):

Protection against the effects of noise exposure shall be provided when the sound levels exceed those shown in Table G-16 when measured on the A scale of a standard sound level meter at slow response. When noise levels are determined by octave band analysis, the equivalent A-weighted sound level may be determined as follows: [Graph, Fig. G-9, not reproduced.]

Table G-16—Permissible Noise Exposures[1]

| Duration per day, hours | Sound level dBA slow response |
|---|---|
| 8 | 90 |
| 6 | 92 |
| 4 | 95 |
| 3 | 97 |
| 2 | 100 |
| 1 1/2 | 102 |
| 1 | 105 |
| 1/2 | 110 |
| 1/4 or less | 115 |

[1] When the daily noise exposure is composed of two or more periods of noise exposure of different levels, their combined effect should be considered, rather than the individual effect of each. If the sum of the following fractions: $C_1/T_1 + C_2/T_2 \ldots C_n/T_n$ exceeds unity, then, the mixed exposure should be considered to exceed the limit value. $C_n$ indicates the total time of exposure at a specified noise level, and $T_n$ indicates the total time of exposure permitted at that level.

29 CFR 1910.95(b)(1):

When employees are subjected to sound exceeding those listed in Table G-16, feasible administrative or engineering controls shall be utilized. If such controls fail to reduce sound levels within the levels of Table G-16, personal protective equipment shall be provided and used to reduce sound levels within the levels of the table. Exposure to impulsive or impact noise should not exceed 140 dB peak sound pressure level.

One "serious" citation was issued to Southwest August 11, 1978, as the result of an inspection July 13-27, 1978, of its corrugated box factory at El Paso, Texas, by an industrial hygienist of the Occupational Safety and Health Administration (OSHA). Southwest gave timely notice of contest on August 25, 1978, and thereafter a complaint and answer were filed with the Occupational Safety and Health Review Commission ("the Commission") pursuant to §10 of the Act.

After six days of hearings at El Paso May 1-4, 1979, and May 24 and 25, 1979, the parties submitted post-hearing briefs[2a]. Southwest also submitted proposed findings of fact and conclusions of law. No affected employee or authorized employee representative participated in this proceeding.

Southwest's 10-page answer denied all allegations of the complaint except those alleging that it is engaged in a business affecting commerce and has employees within the meaning of §3(5) of the Act. It also raised numerous defenses, including: (1) The Act unconstitutionally delegates

---

[2a] By motion dated October 15, 1979, Southwest requested leave to file a reply brief, which was submitted with the motion. The grounds of the motion are alleged "misstatements of fact and omissions of material fact" in the Secretary's post-hearing brief. The Commission's rules do not provide for reply briefs. In this case the parties were informed by letter dated July 11, 1979, that "[r]eply briefs are not favored, but, if one side briefs a point not covered in the other's brief, the latter may petition to file a reply brief, stating the reasons for not covering the point in the original brief." The original time for filing briefs was extended to August 25, 1979. If Southwest's motion were to be granted, the Secretary in all fairness should be given an opportunity for replication. This would unduly delay the issuance of the decision. Also, Southwest has given no compelling reason for filing its reply brief, which in any event is largely a repetition of its post-hearing brief. Therefore, leave to file the reply brief is denied.

legislative and judicial powers to the Secretary, OSHA and the Commission to promulgate, publish and enforce standards of criminal and other conduct contrary to Articles I and III of the Constitution; (2) the Act is unconstitutional in that it discriminates against employers by subjecting them, but not their employees, to penalties and the expenses associated with enforcement proceedings; (3) the Act, as it is enforced, is unconstitutional, offending in particular Articles I and III and amendments 5, 6 and 14 thereof; (4) the Secretary acted arbitrarily, without reasonable basis, without authority and contrary to §6 of the Act, and without proper notice in the promulgation of the noise standards here involved; (5) the noise standards are unconstitutionally vague, ambiguous, unreasonable, arbitrary and capricious, and their enforcement would deprive Southwest of property without due process of law; (6) the noise standards are unequally enforced, depriving Southwest of the equal protection of the law; (7) the noise standards are neither national consensus nor established federal standards under §3(10) of the Act and were promulgated contrary to the §6(b) of the Act and the Administrative Procedures Act, 5 U.S.C. Ch. 5; (8) the inspection here involved was invalid (a) under the Act, (b) as a denial of due process, and (c) as an unreasonable search and seizure; (9) the complaint is inconsistent with and illegally amends the citation and is without statutory basis or authority; (10) the citation should be vacated for lack of particularity under §9(a) of the Act; and (11) the Secretary has not provided respondent with a resonable, tested, proper, practical or economically feasible solution or means to correct the alleged violative condition.

Southwest's brief concedes that the Commission cannot decide the issues pertaining to the constitutionality of the Act.[3] Many of the other defenses raised by the answer are not argued in Southwest's brief, but it requests rulings on "all litigated issues."[4] Not only would this make for an inordinately long decision, but it is unnecessary in view of the disposition to be made in this case. See Weyerhaeuser Co., 77 OSAHRC 44/D6, 5 BNA OSHC 1275, 1977-78 CCH OSHD ¶21,716 (No. 11869, 1977), where the attorney here representing Southwest made a similar request, with the same result.

The basic issues to be decided are whether Southwest violated §5(a)(2) of the Act and the standards codified at 29 CFR 1910 §§95(a) and 95(b)(1). In the process, it will be necessary to touch on some of the issues raised by Southwest.

## DISCUSSION AND OPINION

### Background

The existence of a noise problem in the corrugated box manufacturing industry is rather well known[5], though only three such cases, two involving

---

[3] Sugar Cane Growers Cooperative of Florida, 76 OSAHRC 162/E4, 4 BNA OSHC 1320, 1976-77 CCH OSHD ¶20,795 (No. 7673, 1976).

[4] Southwest was allowed to make a full record on all issues, even though some of them have been decided by the Commission in other cases; it has the right to attempt to convince the Commission to reverse itself, or, failing that, to appeal to the courts.

[5] See p. 1 of Exhibit R-39, a report on a study commissioned by the Fibre Box Association and manufacturers of corrugator machinery.

Weyerhaeuser Co.[6] and one involving Love Box Co.[7], have resulted in Commission decisions. None of these cases, which will be discussed later, resulted in the affirmance of a noise citation.

Corrugators have several components in linear arrangement which corrugate paperboard and adhere to it on both sides sheets of paper to form corrugated cardboard from which shipping containers are made. Auxiliary machines cut, fold and imprint the procduct in a variety of sizes and shapes to meet customers' specifications, as well as salvaging waste materials. All of this is an integrated and complex operation. The plant here involved is typical except that the machines are old, were made by several manufacturers, and require more manual adjustments than their more modern counterparts.

The corrugator has a "wet" end, in which steam, starch and glue are used, and a "dry" end in which conveyors carry the product over hotplates for drying and past trimmers and knives which cut it to desired dimensions..

The "wet" end starts with two machines called single-facers which corrugate the paperboard and use starch to affix a facing on one side. Then comes a double-backer which sticks paper to the other side. These machines

---

6 Weyerhaeuser Co. (Westbrook, Maine), 74 OSAHRC 57/F4, 2 BNA OSHC 1152, 1974-75 CCH OSHD ¶18,468 (Nos. 2116 and 2250, 1974); Weyerhaeuser Co. (Honolulu), 77 OSAHRC 44/D6, 5 BNA OSHC 1275, 1977-78 CCH OSHD ¶21,716 (No. 11869, 1977).

7 Love Box Co., 76 OSAHRC 45/D5, 4 BNA OSHC 1138, 1975-76 CCH OSHD ¶20,588 (No. 6286, 1975).

are connected overhead by a "bridge" on which product may accumulate to facilitate coordination of the various components.

The corrugating mechanism in the single-facers are "flutes", which are counter-rotating fluted rolls with a pressure roll to keep the desired tension on the product. These flutes and pressure rolls are the major sources of noise in the plant.

Southwest's El Paso plant was installed in a building constructed as a warehouse, with the corrugator machines arranged parallel to and about 6 feet from an exterior wall. These machines are operated, or controlled, from the other side, which has a passageway about 15 feet wide bounded by concrete block rooms for steam generation, glue and starch preparation, and salvage machines known as a "hogger" and a baler. At the time of the inspection, however, the hogger and baler were not in a separate room but were near the dry end of the corrugator.

Southwest is an integrated forest products company with approximately 6,500 employees and 1978 gross sales of approximately $600 million (Tr. 4). It has other corrugated box plants, but its relative size in the industry was not established.[8]

The validity of the noise standards.

Southwest has attacked the validity of the noise standards on several grounds, listed above. These contentions all are answered by Commission

---

[8] Weyerhaeuser, with 31 corrugated box plants, is the industry's largest (Tr. 753).

decisions which are binding precedent as far as the Commission's judges are concerned. Grossman Steel and Aluminum Corp., 76 OSAHRC 54/D9, 4 BNA OSHC 1185, 1975-76 CCH OSHD ¶20,691 (No. 12775, 1975).

The noise standard was held not to be unenforceably vague in Turner Co., Div. of Olin Corp., 76 OSAHRC 108/A2, 4 BNA OSHC 1554, 1976-77 CCH OSHD ¶21,023 (No. 3635, 1976), rev'd on other grounds, 561 F.2d 82 (7th Cir., 1977); Castle & Cooke Foods, a Div. of Castle & Cooke, Inc., 77 OSAHRC 87/A2, 5 BNA OSHC 1435, 1977-78 CCH OSHD ¶21,854 (No. 10925, 1977); Weyerhaeuser Co. (Honolulu), supra, 1976-77 CCH OSHD ¶12,080.

Turner Co. also answered Southwest's contentions that the noise standards are invalid because they were improperly promulgated under §6(b) of the Act and are not "established Federal standards" which §3(10) of the Act permitted to be adopted without the full rulemaking procedure. (Their origin was the Walsh-Healy Act, so they are not "national consensus standards").

Southwest's contention that the noise standards are arbitrary and capricious, and therefore invalid, refers to the requirement of §95(b)(1) that feasible administrative or engineering controls be utilized to prevent excessive exposure to noise when personal protective devices (ear plugs or muffs) are effective and much less expensive. This matter will be discussed later, in connection with the issue of economic feasibility of engineering controls.

The citation and complaint.

Southwest attacks the citation for lack of particularity and the complaint for supplying by amendment the information lacking in the citation.

It is well settled that the particularity required by §9(a) of the Act may be supplied by the complaint or by the discovery procedures (which were amply utilized in this case), or at the hearing. In a very recent noise case, Meadows Industries, Inc., 79 OSAHRC _____, 7 BNA OSHC 1718, 1979 CCH OSHD ¶23,847 (No. 76-1463, 1979), the Commission held that a citation which "failed to state with particularity the noise levels found at the plant or the exact locations where they were found" still gave the employer "fair notice of the general locations of excessive noise levels" and was sufficient. Here the citation, while it did not name the employees involved or specify the noise levels to which they were exposed, gave the areas and machines involved and identified the employees as the operators of those machines. This was at least as much, and apparently more, "particularity" than found in the Meadows citation.

The complaint listed four employees by name and for each gave the work area (machine), the sound levels to which he was exposed, and the percent of unity (permissible levels of exposure). It also specified the date of the exposures as "on or about July 25, 1978," whereas the citation had shown the inspection dates as July 13-27, 1978. This was more than sufficient "particularity" under Meadows.

The inspection.

Southwest has not briefed the defense, raised in its answer, that the inspection was invalid (a) under the Act, (b) as a denial of due process, and (c) as an unreasonable search and seizure. Therefore, it may be deemed abandoned. Anyway, I find nothing in the record to substantiate this defense.

It is possible that Southwest had in mind the noise testing procedures used by OSHA's industrial hygienist, that is, the use of audio dosimeters to measure the noise levels to which employees were exposed. This matter will be discussed in some detail next.

The use of dosimeters

OSHA's industrial hygienist, Steven Brisbin, used General Radio audio dosimeters, backed up with occasional readings with a sound level meter (SLM), in measuring the noise levels to which Southwest's employees were exposed. Southwest contends that use of dosimeters is not authorized by 29 CFR 1910.95(a), that dosimeters are inherently inaccurate, and that the most accurate methodology is a combination of frequent SLM readings and a time-and-motion study to determine what proportion of his time each employee spends at the locations chosen for testing.

Both methods have been approved by the Commission. Love Box Co., supra, specifically approved the use of dosimeters as the primary instrument, backed up, as here, by SLM readings, and in the recent case of Wheeling-Pittsburgh Steel Corp., 79 OSAHRC _____, 7 BNA OSHC 1581, 1979 CCH OSHD ¶23,784 (No. 14702, 1979), it affirmed a citation based primarily on SLM readings which were confirmed by dosimeter measurements. On the other hand, it has approved the taking of "spot" or "grab" samples with an SLM "if it is reasonable to infer that the measured sound levels are representative of sound levels for the pertinent duration of time. . ." Weyerhaeuser Co. (sawmill - plywood mill case), 77 OSAHRC 9/A2, 4 BNA OSHC 1972, 1976-77 CCH OSHD ¶21,465 (Nos. 1231 and 1758, 1977).

Actually, as pointed out in Love Box, an audio dosimeter is basically a compact SLM with a memory cell which, when placed into a read-out instrument, displays the noise level as a percentage of the permissible level (100% or less indicating compliance). It is small enough to be placed in an employee's shirt pocket, with the microphone at or near his ear. It is used to measure the noise level experienced during an entire work shift, obviating the problem of whether a test sample is "representative," a problem which is acute in the present case.

Southwest maintains that there is no such thing as a typical day in its box plant—that it processes orders of varying sizes calling for different weights and widths of paper, which factors in turn dictate lengths and speed of runs and amount of downtime. All of these factors combine complexly to affect noise levels. They also add to the difficulty of devising an accurate time-and-motion study and relating it to noise measurements.

OSHA's Industrial Hygiene Field Operations Manual ("FOM")[9] says at part III(A) of Ch. VI that the audio dosimeter "serves to give maximum possible personal noise sampling of an exposed subject and is used as the primary basis for issuing a citation."[10] (Emphasis supplied.)

---

[9] Ch. XI of the FOM was introduced into evidence as Exh. R-3. Official notice is taken of the remainder.

[10] The audio dosimeter also is authorized for use in underground coal mines by 30 CFR 70.505 and 506, but this is not relied upon here.

However, in recognition of human and equipment errors, as well as "legal considerations," FOM Ch. IX, ¶16 forbids the issuance of a citation unless permissible noise levels measured by a dosimeter are exceeded by a factor of 1.30. This is crucial here because one of the measurements relied upon by the Secretary was only 131.1% of the permissible level.

A Type 2 dosimeter, such as was used here, is designed to be accurate to ± 2 dBA. Thus a reading of 90 dBA (equivalent to 100%) could actually mean anything from 88dBA (75%) to 92 dBA (130%). The wide variation in the percentage of permissible noise is due to the fact that the decibel scale is "logarithmic rather than arithmetical," so that an increase of 3 dBA represents a doubling of the air pressure at the listener's ear. Continental Can Co., Inc., 76 OSAHRC 109/A2, 4 BNA OSHC 1341, 1976-77 CCH OSHD ¶21,009, f.n. 8 (Nos. 3973, et al., 1976).

The SLM used by Southwest's noise expert, William Halvorsen, also was a type 2 (Tr. 1024), which means that its rated accuracy likewise is ± 2 dBA. However, there are type 1 SLMs, and their accuracy ratings are ± 1 dBA.

Southwest introduced expert testimony regarding factors which affect dosimeter accuracy, especially calibration. Brisbin was cross-examined about these matters, but it was not demonstrated that he departed significantly from the instructions in FOM Ch. VI for the calibration and use of dosimeters. Part E(1) of Ch. VI says that dosimeters should be calibrated "before and after using." Brisbin calibrated his dosiemter the afternoon or evening before their use (Tr. 56; Exh. C-1). In view of the time required to calibrate the 11 dosimeters he used, he could hardly be expected to do it at Southwest's plant.

In the absence of any evidence showing that their accurary was affected by the calibration the day before use, I find that this is insufficient to justify discarding the results of the inspection.

Also, in view of the Commission's approval of the noise measuring methods used by both parties, and in the absence of a showing that Brisbin failed to follow the procedures prescribed by the FOM or that his measurements were in fact so inaccurate as to affect the result, I find that the use of audio dosimeters was proper.

The alleged violation of 29 CFR 1910.95(a).

The 131.1% measurement referred to above was made on Joe Carrillo, operator of a labeling machine called a Staley, which is not a part of the corrugator. Corrillo was not wearing ear plugs or other personal protective device (Tr. 103). Item 1A alleged a serious violation of 29 CFR 1910.95(a) because protection was not provided against the effects of noise exposure in excess of Table G-16 levels.[11]

At the time of the inspection, the Staley machine was near the "hogger," which shreds scrap cardboard, and the baler, which bales it for shipment. The hogger was a major source of the noise in the area of the Staley machine.

Subsequent to the inspection, the hogger and baler were moved into a separate concrete block room, and measurements made thereafter by experts

---

[11] See footnote 2.

employed by both parties indicated that there no longer was a noise problem at the Staley machine. Therefore, no administrative or engineering controls were proposed at the hearing for the Staley (which was also included in the §95(b)(1) citation). Thus the question is whether the noise exposure and lack of hearing protection for Carrillo on the inspection date is a violation of §95(a). I find that it is, for it is the condition that existed on the inspection date that counts. This is true even though Southwest at that time had plans to move the hogger and baler and so informed the inspector.

During the dosimeter test on July 25, 1979, 16 measurements were made with an SLM in the Staley area, 8 while the machine was running and 8 while it was not (Exhibit C-2). With the Staley not operating, the noise levels ranged from 83 to 88 dBA, and while it was operating the noise levels varied from 89 to 94 dBA. Brisbin testified in general that the SLM readings confirmed the dosimeter readings (Tr. 85, 185). Southwest's proposed finding of fact No. 37 (and several statements in its brief) takes out of context a statement by Brisbin, "There is a definite inconsistency if you're trying to compare my readings I took with a Sound Level Meter with the results of a Dosimeter" (Tr. 175). The question and answer, on redirect examination, were as follows:

> Q. You were asked on cross-examination about the readings found at the hogger and at the staley and the ranges that you found. Did you see any inconsistency in those readings?
>
> A. There is a definite inconsistency if you're trying to compare my readings I took with a Sound Level Meter with the results of a Dosimeter. Understand that a Sound Level Meter reading is taken, ten during a day, where a Dosimeter is integrating an entire full shift exposure. So, my hand-held

reading does not take into account the fact that, say, we used an example of a hogger operator at 108. There's nothing in my Sound Level Meter results stating that right after that reading that employee could have been in a 50 db exposure. So I wouldn't expect, just because I measured 108 with a Sound Level Meter that I'm going to get 108 Dosimeter read-out. Do you follow me?

Read as a whole, Brisbin's answer seems to be to the effect that an SLM reading cannot be expected to conform exactly to a dosimeter readout, because the sound level meter does not reflect what happens between readings.

The SLM readings in the Staley area, with their corresponding percent of unity, were as follows:

| Staley Not Operating | | Staley Operating | |
|---|---|---|---|
| SLM Reading | % Unity | SLM Reading | % Unity |
| 88 dBA | 80 | 91 dBA | 114 |
| 88 dBA | 80 | 92 dBA | 130 |
| 84 dBA | 45 | 91 dBA | 114 |
| 83 dBA | 40 | 94 dBA | 175 |
| 83 dBA | 40 | 92 dBA | 130 |
| 88 dBA | 80 | 89 dBA | 87 |
| 84 dBA | 45 | 89 dBA | 87 |
| 83 dBA | 40 | 92 dBA | 130 |

As previously mentioned, Brisbin testified generally to the effect that the SLM readings backed up the dosimeter readouts. This appears to be true with regard to the Staley area.

Carrillo's failure to wear ear plugs or other personal protective device was a prima facie violation. Southwest has not affirmatively pleaded or argued the defense of unpreventable employee misconduct, though it introduced evidence that it had a work rule requiring the wearing of ear plugs or ear muffs "in any area identified as having excess noise levels" (Exh. R-48, p. 7). There was no showing that the Staley area had been so designated.

Carrillo did not testify.

I find that §95(a) was violated.

This item, in combination with item 1B, is alleged to be a "serious" violation under §17(k) of the Act, which defines a "serious" violation as one in which "there is a substantial probability that death or serious physical harm could result" therefrom. The tenor of the expert testimony in this case was that overexposures to noise in the range here present (slightly over 92 dBA) would take long periods of time to substantially affect human hearing, though this varies individually. There was no evidence that Carrillo had suffered any hearing loss as a result of this exposure.

Research has disclosed no case in which a noise violation has been held to be "serious." In fact, the secretary has made a practice (at least until recently) of citing such violations as other than serious.

Undoubtedly loss of hearing can be a severe handicap. However, it seems to me that the Act contemplates a more immediate onset of disability than is likely in such a case as this §95(a) violation. Therefore, I find that this violation, standing alone, is nonserious and that no penalty should be assessed.

The alleged serious violation of 29 CFR 1910.95(b)(1).

Item 1B, as amended by the complaint, alleges a serious violation of 29 CFR 1910.95(b)(1)[12] in that feasible engineering contracts were not utilized to protect 4 employees against the effects of noise exposure.

The employees involved, their work areas and exposures were listed as follows:

| Employee | Work Area | Sound Level* (DbA) | Percent of Unity** |
|---|---|---|---|
| Jose Vega | Corrugator | 89 to 99 | 293.7% |
| Jessie Jean | Corrugator | 79 to 104 | 289.7% |
| Angel Holguin | Knife Operation | 81 to 97 | 176.8% |
| Joe Carrillo | Staley | 75 to 94 | 131.1% |

* The sound levels noted show the minimum and maximum levels measured on the A scale of a standard sound level meter at slow responses, with at least 10 separate readings having been taken at each location.

** When the daily noise exposure was composed of two or more periods of noise exposure at different levels, the percentage of unity indicates the sum of the variables $\frac{C_1}{T_1} + \frac{C_2}{T_2} + \ldots \frac{C_n}{T_N}$ (where $C_n$ is the total time of exposure at a specified noise level and $T_n$ is the total time of exposure permitted at that level). Permissible levels of exposure and corresponding time periods are found in Table G-16 of 29 CFR 1910.95.

As previously mentioned, no engineering controls were proposed for the Staley area at the hearing, so it will not be considered. The same is true of the knife operation, which is on the dry end of the corrugator near the Staley.

[12] See footnote 2.

Therefore, only the corrugator operator positions need be considered. Thus the central issue is whether the proposed engineering controls are technologically and economically feasible, which the Secretary has the burden of proving. Continental Can Co., supra. The technological feasibility issue will be considered first.

Industrial Hygienist Brisbin testified to noise exposures as alleged in the complaint regarding the July 25, 1978, inspection (Tr. 81, Exh. C-1). It is difficult to compare the results of Halvorsen's study made January 4, 1979, with Brisbin's because Halvorsen's SLM readings were not presented in a readily usable form. His notes (Exh. R-9) show readings of 100 to 102 dBA at the B-flute single facer, 94 dBA at the C-flute single, 98 dBA at both single facers, 83 to 92 dBA at the double backer, and 90 to 92 dBA at the knife area. These readings are fairly consistent with Brisbin's, and in any event they show noise levels in excess of Table G-16.

The Secretary's noise expert, Dr. Calvin C. Oliver, an acoustic consultant and mechanical engineer, made a survey of Southwest's plant January 4 and 5, 1979, using an SLM with octave band filter attached. He determined the major sources of noise to be the two single facers and the double backer, for which he proposed engineering controls consisting of a 10-foot long barrier on the operator's side of each of these machines, with a curtain of vertical, overlapping transparent plastic strips extending from each end of each single-facer barrier to the wall on the opposite side and from the bridge to the floor. He also proposed that a metal hood be suspended from the ceiling, extending down to the barriers over the three machines.

After analyzing the spectra, or frequencies, of the noise generated by these machines, Dr. Oliver recommended that 6 inches of sound-absorbent material be placed on the inside (machine side) of each barrier. He also recommended that a 2' X 4' window be placed in each barrier. Stop and speed controls would be moved outside the barrier (Tr. 639-645; Exh. C-24). The hood, while serving to attenuate sound, would also vent steam and heat from the wet end of the corrugator. Dr. Oliver opined that these controls would reduce the noise exposure, expressed as a percentage of permissible levels, by half, e.g., from 300% to 150% (Tr. 722). He did not express this in terms of decibels, but it would be 5 decibels in that illustration. Mr. Halvorsen, on the other hand, estimated that the reduction in noise levels for the operators of these machines would be 1 1/2 dBA, that is, from 98 to 96.5 dBA (Tr. 1032, 1057). This would be a reduction from 300% to 250% of permissible exposure.

Southwest made numerous objections to the technological feasibility of the proposed controls, including the slight attenuation that might be expected, interference with operation of the corrugator, creation of heat, dust and fire hazard problems, and inability of the plant's ceiling to support the ventilating hood.

The barriers proposed by Dr. Oliver are not novel in design. In fact, similar installations exist in at least 4 other corrugated box plants, but the witnesses were at odds on their effectiveness. Dr. Oliver based his opinion on similar barriers he had seen in use at the Inland Container Co. plants at Hattiesburg, Mississippi ("Inland - Hattiesburg") (Tr. 615, 636, 638, 717, 741, 1288; Exh. C-24, fig. 3) and Macon, Georgia ("Inland - Macon") (Tr. 677-687).

He had made SLM measurements of noise levels at Inland - Hattiesburg and found them to be as high as 101 dBA inside the barrier and 89 dBA outside it.

Don Harvey, a supervisor of OSHA industrial hygienists, inspected Inland - Hattiesburg August 7, 1975, when no barriers were present, and December 27, 1976, after barriers were installed (Tr. 1203-1205). He testified that in 1975 SLM readings showed an "average" employee exposure of 95 dBA (200% of permissible) and that in 1976, when dosimeters and an SLM were used, the single facer operator was exposed to 103% and the double backer operator to 90% of permissible levels.

Halvorsen made dosimeter measurements at Inland - Hattiesburg two days in 1977 (after the barriers were installed) and found operating personnel had a noise exposure equivalent to 90 dBA (or 100%) on the first day and an unquantified "over exposure" on the second day (Tr. 1033). Halvorsen pointed out, however, that Inland - Hattiesburg had roll-out roll stands, which require the operators to work less under the machine than the stationary roll stands at Southwest - El Paso, thus reducing their noise exposure (Tr. 1038).

On the whole, it appears from the testimony of Dr. Oliver, Harvey and Halvorsen that sound barriers and hoods of the type proposed here have been successful to some degree in reducing noise exposure at Inland - Hattiesburg but that Table G-16 levels may be exceeded at times.

Dr. Oliver made two visits to Inland - Macon in December 1977 and December 1978. The first visit was made because Inland - Macon had reported to OSHA that it could control the noise level on one but not two single facers with barriers. However, in 1977 the barriers were not coated

with absorbent material, and Dr. Oliver recommended they do this and make other (unspecified) changes. When he returned a year later the absorbent material had been installed on the barriers, but the plant was practically shut down due to labor negotiations so Dr. Oliver made no noise measurements. Thus the effectiveness of such controls at Inland - Macon was not established.

Weyerhaeuser Co. has at least two plants which have sound barriers somewhat similar to Dr. Oliver's proposals, one at Tampa, Florida ("Weyerhaeuser - Tampa") and one at Jackson, Mississippi ("Weyerhaeuser - Jackson"), and its manager of manufacturing services in its shipping container division, Walter G. Paulson, testified for respondent (Tr. 752-813). Both were new, post-OSHA plants incorporating the latest in noise controls, the Tampa plant having been built in 1972 or 1973 and the Jackosn plant in 1974 (Tr. 761, 782). They had much longer barriers than here proposed, and in addition they had numerous baffles (but no hoods) suspended from the ceiling. They also had acoustic block walls. Despite these controls, noise measurements were 96 to 98 dBA, so that employees still have to wear ear plugs and ear muffs, Paulson testified (Tr. 812). He also said that the barriers interfered with production and had to be shortened to 20 feet, and that the 3' x 3' window in one of the barriers was removed because employees complained of the heat (Tr. 791).

Paulson admitted that Weyerhaeuser is interested in the outcome of Southwest's case (Tr. 802). Whether the engineering controls used at Tampa and Jackson reduced employee exposure to noise was not established, since the plants were new and afforded no "before-and-after" comparison.

However, Paulson's dislike of such controls was apparent. He testified that they caused a fire hazard due to dust deposits (Tr. 779), caused heat problems which affected the bonding of materials (Tr. 773), caused more frequent "wrap-ups" of paper (Tr. 774), and increased noise exposure of operators (Tr. 770). He predicted similar or worse results at Southwest - El Paso (Tr. 771).

Cecil S. Fleming, a loss control consultant who was Southwest's loss control director from April, 1976, to April 20, 1979, testified that the roof structure at Southwest - El Paso was not strong enough to support the partitions[13] and hood (Tr. 1154); that such overloading of the roof structure might be a violation of 29 CFR 1910.22[14] (Tr. 1156); that the machines cannot be used as supports because they must be realigned occasionally (Tr. 1155); that collisions of forklifts (actually "clamp" trucks) and paper rolls with the barrier would be inevitable because the aisle on that side already is too narrow for the forklift to turn around (Tr. 1158, 1159); that the sprinkler system would have to be modified at a cost of $83,000 (Tr. 1159); that the heating requirements would be greater in winter due to the barriers and hoods (Tr. 1164); that the conveyor might have to be lengthened in the dry end of the

---

[13] Fleming apparently thought the barriers as well as the hood would be supported by the roof structure.

[14] §1910.22(d)(2) provides:

> It shall be unlawful to place, or cause, or permit to be placed, on any floor or roof of a building or other structure a load greater than that for which such floor or roof is approved by the building official.

corrugator to dry out the product due to confinement of steam (Tr. 1165); and that finely divided residue from the operation would settle on the barriers and curtains and be a fire hazard (Tr. 1187, 1188).

Fleming also testified that the barriers would block egress of employees on the wall side of the corrugators and violate 29 CFR 1910.37 unless an exit door was cut in the load-bearing wall at a cost of $5,000 (Tr. 1161, 1162), but he apparently did not realize that the curtains enclosing the ends of the single facers would be transparent plastic strips rather than solid structures.

Of the two corrugator operators named in the complaint (Jose Vega and Jessie Jean), only one (Vega) testified. However, Angel Holguin, named in the complaint as a knife operator, and now a corrugator or single facer operator, testified, as also did Jose Rocha and Eddie Fattorini, double backer operators who assist the corrugator operators.

Vega testified that frequent adjustments have to be made to the machines (Tr. 238); that he has to touch the paper to test the pressure; that it takes about 3 minutes to push a fresh roll into the machne (Tr. 239); that he can start, stop and govern the speed of the machine from the controls (Tr. 244, 245); that the brake is manually operated (Tr. 257); that there are adjustments on the roll stands (Tr. 257); that when the paper breaks he must stop the machine in 30 seconds (Tr. 261); and that a noise barrier should have a big window in it (Tr. 253).

Holguin testified that the machine has 10 rolls (Tr. 286); that the brakes must be loosened as the rolls get smaller (Tr. 280); but that if all goes well the machine requires few adjustments (Tr. 281).

Rocha said he helps with roll changes, splices, paper breaks, glue and starch (Tr. 362, 371); that he doesn't adjust the machine (Tr. 367); and that he stands in the hallway near the machine while watching it (Tr. 366).

Fattorini testified it is necessary to go under the bridge to change rolls (Tr. 438); that he is not supposed to slow the machine to put a roll in (Tr. 440); that a full roll lasts 45 minutes to an hour (Tr. 444); that there are separate controls for the single facers and double backer (Tr. 440); that the double backer can be controlled from the single facers but not vice versa (Tr. 447); that he can get as much as 50 feet away from the controls when he is acting as operator (Tr. 443); that he spends about 40 minutes of each hour watching the machine (principally the bridge) (Tr. 458); that most of the adjustments are made when the machine is started in the morning (Tr. 451); that he would have problems if he couldn't hear the machines, at least the breaking of the paper (Tr. 456); and that breakdowns occur from twice a week to once a month (Tr. 460).

Gabriel Pena, a knife man, testified that the corrugator, if enclosed, would "be like a sauna bath" (Tr. 320).

In Love Box Co., supra, the Commission held an "acoustical booth" for a corrugator operator technologically infeasible because his duties were not stationary but required him to return "every minute or so" to the face of the machine. It mentioned the experiments of the Fibre Box Association (a trade association of corrugated box manufacturers) with a "tight-end" enclosure for the single facer. This type of enclosure has since been abandoned by the association (Exh. R-39). The question is whether the state of the art of

engineering noise controls for corrugators, as reflected by the record in this case, has advanced sufficiently since Love Box to make them technologically feasible.

From what has been said about the Inland - Hattiesburg, Weyerhaeuser - Tampa, and Weyerhaeuser - Jackson plants, it is apparent that controls such as here proposed have been marginally successful in new plants and with newer, more automatic machines than Southwest's. It may seem anomalous that a large employer like Southwest can get by with obsolescent machines in a building not designed for or well suited to the purpose, but the alternatives would be harsh indeed.[15]

Due in large measure to the antiquity of its machines, it is necessary for the operators to make frequent manual adjustments to and maintain visual and aural contact with, the single facers and double backer. This would limit the time they could remain behind the barrier, and when in front of the barrier their noise exposure would be considerably greater than if it did not exist.

The plant itself, including the weakness of the roof structure and the narrowness of the aisle on the operator's side, also tends to make the proposed controls infeasible. These matters might be corrected, but at great cost which was not considered by the Secretary's expert. Heat problems affecting the product and a fire hazard affecting the safety of personnel and

---

[15] Robert White, general manager of Southwest's El Paso plant, testified that a new corrugator would cost $1 million (Tr. 469), and Paulson testified tht the costs associated with noise control at Weyerhaeuser - Tampa totalled $271,785 (Tr. 769). Economic feasibility is discussed more fully at pp. 26-28.

the plant would also be created. The cumulative effect of these and other objections raised by Southwest is the conclusion that the imposition of such controls would have significantly adverse effects on the whole operation.

Even if these effects could be tolerated, or to some extent overcome, there is a serious question concerning the attenuation of noise levels that might reasonably be expected to result from these controls as previously mentioned. Dr. Oliver opined that the noise levels for the corrugator operators would be reduced from about 300% of the permissible level to 150%. Mr. Halvorsen calculated the reduction at 1 1/2 dBA, that is from 98 to 96.5 dBA, which would be equivalent to a reduction from 300% to 250% of the permissible. The truth may lie somewhere between these estimates, but Halvorsen's estimate seems the more accurate.

Both estimates are above Table G-16 levels. This means that employees still would have to wear ear plugs or muffs, but the Commission has held that controls may be required in such a situation if they will significantly reduce the exposure even though not to Table G-16 levels. RMI Co., 78 OSAHRC 31/C8, 6 BNA OSHC 1523, 1978 CCH OSHD ¶22,674 (No. 13773, 1978).

The expected results, however, must be measured in terms of cost, which makes the issue of economic feasibility inseparable from technological feasibility.

Dr. Oliver, who had no expertise in construction costs and did not give the source of his cost estimates, testified that his proposed engineering controls would cost $35,000 (Tr. 660). He did not consider that there would be any effect on product quality or plant productivity (Tr. 674).

Fleming, while not providing an overall cost figure, testified on the basis of his experience as an engineer and contractors' estimates that it would cost $27,850 to relocate the electrical switching gear (Tr. 1150), as compared to Dr. Oliver's estimate of $4,000 to $8,000; that the sprinkler system would have to be modified at a cost of $3,000; and that an egress door in the load-bearing wall would cost $5,000. No estimate was made concerning the cost of strengthening the roof to support the hood or of moving the interior room walls on the barrier side of the machines to provide more room for clamp trucks. Neither did Southwest establish the cost of personal ear protection for a comparison such as was made in Weyerhaeuser Co. (Honolulu), supra.

The presently effective economic feasibility guidelines in noise cases were laid down in Continental Can Co., 76 OSAHRC 109/A2, 4 BNA OSHC 1541, 1976-77 CCH OSHD ¶21,009 (No. 3973, 1976), where controls costing $494,000 would have reduced noise to Table G-16 levels for 125 employees (and a lesser amount for an unspecified number of others), and the Commission held there was insufficient proof of economic feasibility though it held that a reduction of 3 decibels would be "clearly significant."

In Weyerhaeuser Co. (Honolulu), supra, Judge Burchmore's decision on remand (which was affirmed without review by the Commission; 1977-78 CCH OSHD ¶21,716) held economically infeasible barriers at the single facer costing $20,000 which would reduce exposure of 4 employees 2 decibels, as compared to the $5 cost of ear protectors for each employee.

In Castle & Cooke Foods, supra, where the expected reduction was to Table G-16 levels from a range of 95 to 101 dBA, implementation costs per empoyee of $3,100 and $3,400 in two different plants (plus annual costs of $1,100 and $111, respectively) were held to be infeasible economically.

And in Great Falls Tribune 77 OSAHRC 86/B7, 5 BNA OSHC 1443, 1977-78 CCH OSHC ¶21,844 (No. 6632, 1977), where the expected reduction was from 100 to 93.5 dBA at a cost of $12,500 per employee, the proposed controls again were held not economically feasible.

Here the cost of controls, using the Secretary's figures, would be $35,000 for 3 employees, or $11,666 per employee for installation, with no figure for annual cost impact. The attenuation that might be expected (1 1/2 dBA according to Southwest and 5 dBA according to the Secretary) would still leave the exposure above Table G-16 levels. Under the guidelines of the Commission decisions, economic feasibility has not been proved.

The costs issue.

Lastly, Southwest requests that it be awarded attorney fees and costs incurred because the Secretary allegedly concealed exculpatory information and refused in pretrial discovery to admit certain facts as requested by Southwest.

Commission precedent clearly holds that, absent statutory authority, it has no power to award attorney fees or costs against any party, hence it is unnecessary to inquire into the merits of the matter. General Electric Co., 75 OSAHRC 50/A2, 3 BNA OSHC 1031, 1974-75 CCH OSHD ¶19,567 (No. 2739,

1975); John W. McGowan, 77 OSAHRC 189/E10, 5 BNA OSHC 2029, 1977-78 CCH OSHD ¶22,268 (No. 76-1308, 1977).

## FINDINGS OF FACT

1. The respondent is an employer engaged in commerce who has employees within the meaning of 53(5) of the Act. It operates a corrugated box factory at El Paso, Texas, which was inspected by an OSHA industrial hygienist on July 13-27, 1978.

2. On July 25, 1978, Joe Carrillo, a Staley machine operator, was exposed to a noise level equivalent to 131.1% of the permissible level for an 8-hour shift, and at that time he was not protected by personal hearing protection device or otherwise from the excessive noise. There was no substantial probability that the violative condition could cause death or serious physical harm. No penalty should be assessed.

3. On said date two corrugator operators, Jose Vega and Jessie Jean, were exposed to noise levels of 293.7% and 289.7%, respectively, of the permissible noise level for an 8-hour shift, and no engineering controls were utilzied by Southwest to protect these employees from the excessive noise exposure.

4. Engineering controls in the form of barriers and hoods proposed for the single facers and double backers would reduce the noise levels for operators of those machines approximately 1 1/2 dBA.

5. The noise levels after implementation of the proposed controls would be in excess of those permitted by Table G-16 of 29 CFR 1910.95, and it would

still be necessary for affected employees to use personal hearing protective devices.

6. The cost of implementing the proposed controls would be at least $35,000, and no figures were supplied for annual cost impact.

7. Three employees would be benefitted by the propsoed controls, the single facer operators and the double backer operator.

8. Respondent's corrugator machines are obsolescent, requiring more manual adjustments than modern machines, and they are installed in a warehouse building not designed for or well suited to the purpose. The roof is not strong enough to support the proposed hood, and there would be insufficient room in the aisle where the barriers would be installed to allow maneuvering of clamp trucks carrying paper rolls to the machines. The barriers would cause heat problems affecting the product and a fire hazard due to dust accumulations.

9. The proposed controls are neither technologically nor economically feasible.

## CONCLUSIONS OF LAW

1. The Commission has jurisdiction of the parties and of the subject matter of this proceeding.

2. On July 25, 1979, respondent was in violation of §5(a)(2) of the Act and 29 CFR 1910.95(a), but the violation was nonserious and no penalty should be assessed.

3. On said date respondent was not in violation of 29 CFR 1910.95(b)(1).

## ORDER

On the basis of the foregoing findings of fact and conclusions of law, it is ORDERED that:

1. Item 1A, for serious violation of 29 CFR 1910.95(a), is amended to allege a nonserious violation, and, as so amended, it is AFFIRMED. No penalty is assessed.

2. Item 1B, for serious violation of 29 CFR 1910.95(b)(1), is VACATED.

3. Respondent's requested findings of fact and conclusions of law, to the extent that they are inconsistent with this decision, are denied.

DEE C. BLYTHE
Administrative Law Judge

ORDER OF REMAND

Before: CLEARY and COTTINE, Commissioners.*/

BY THE COMMISSION:

On December 17, 1982, the Commission issued its decision in Sun Ship, Inc., OSHRC Docket No. 16118. In accordance with the decision of the U.S. Supreme Court in American Textile Manufacturing Institute, Inc. v. Donovan, 101 S.Ct. 2478 (1981) ("ATMI"), the Commission held that "feasible" under the occupational noise standard means achievable. The Commission overruled the cost-benefit test of feasibility previously set forth in Continental Can Co., 76 OSAHRC 109/A2, 4 BNA OSHC 1541, 1976-77 CCH OSHD ¶ 21,009 (No. 3973, 1976), appeal withdrawn, No. 76-3229 (9th Cir. Apr. 26, 1977), and substituted a test consistent with ATMI.

In view of this intervening change in law, the judge's decision with respect to the alleged violation of section 1910.95(b)(1) is vacated. The case is remanded for further proceedings, including evidentiary

submissions, so that the interrelated issues of technological and economic feasibility can be reconsidered in light of the test of feasibility established by Sun Ship, Inc.

SO ORDERED.

FOR THE COMMISSION

APPEARANCES:

Paul Katz, Esq.,
For Complainant

Ian Spier, Esq.,
For Respondent

DECISION AND ORDER

This case arose under Section 10(c) of the Occupational Safety and Health Act, 29 U.S.C. §659(c), and was heard June 12 to 14, 1979, at Hartford, Connecticut.

On November 16, 1978, Respondent was issued a 2-item serious citation and a nonserious citation listing one item. All charges were contested. Serious Item 1 is resolved by a settlement agreement, which I hereby approve, wherein Complainant reduces the proposed penalty from $480 to $320, and Respondent withdraws its contest of this item (Ans. IX). The other serious item was reduced to a nonserious charge by Complainant's amended citation dated December 8, 1978, and became Item 2 of the nonserious citation.

Olin Corporation manufactures firearms at a plant at New Haven, Connecticut, where its employees work with goods and materials moving across state lines in interstate commerce; hence, Respondent is an employer engaged in a business affecting commerce within the meaning of §3(5) of the Act (Ans. II). In light of the foregoing, it is determined that the Commission has jurisdiction over the parties and the subject matter.

Nonserious Item 1 alleges a violation of the standard at 29 CFR 1910.95(b)(1) in that employees were subjected to sound levels in excess of those listed in Table G-16 of Subpart G, and feasible administrative or engineering controls were not utilized to reduce the sound.

The standard at 29 C.F.R. 1910.95(b)(1) provides:

> When employees are subjected to sound exceeding those listed in Table G-16, feasible administrative or engineering controls shall be utilized. If such controls fail to reduce sound levels within the levels of Table G-16, personal protective equipment shall be provided and used to reduce sound levels within the levels of the table.

Table G-16 - Permissible Noise Exposure

| Duration per day, hours | Sound level dBA[1/] slow response |
|---|---|
| 8 | 90 |
| 6 | 92 |
| 4 | 95 |
| 3 | 97 |

---

1/ The abbreviation dB stands for decibels, the unit of measurement of sound. On the A scale the measuring instrument reacts to sound in a manner similar to the human ear. For "slow" response the instrument is set so as to average out high level noises of brief duration. See U.S. Department of Labor, Guidelines to the Department of Labor's Occupational and Noise Standards, 1971, p. 3.

Table G-16 (continued)

| Duration per day, hours | Sound level dBA slow response |
|---|---|
| 2 | 100 |
| 1-1/2 | 102 |
| 1 | 105 |
| 1/2 | 110 |
| 1/4 | 115 |

When the daily noise exposure is composed of two or more periods of noise exposure of different levels, their combined effect should be considered, rather than the individual effect of each....

Exposure to impulsive or impact noise should not exceed 140 dB peak sound pressure level.

On October 4 and 10, 1978, Respondent's New Haven facility was inspected by James Stewart, who was at the time employed as an industrial hygienist by the Occupational Safety and Health Administration (OSHA). (Tr. 4-6, 10).

On October 10, 1978, Stewart conducted noise tests at this plant by attaching dosimeters to Respondent's employees resulting in these readings (Tr. 29, 30-31, 39, 42-43, 53-54, 56-57, 68):

| Name of Employee | Location | Work Performed | Time Tested | Reading |
|---|---|---|---|---|
| Abenante | 26A3 | routers | 7 hrs,27 min. | 169.4%[2/] |
| Funderburg | 8A3 | vacuum cleaner; materials handled | 7 hrs,16 min. | 133.2% |
| Joshua | 7A3 | Rye set machine operation | 7 hrs,20 min. | 205.6% |

---

2/ The dosimeter readings are in percentages, convertible to dBA. Decibels are measured on a logarithmic rather than linear scale. Shown below are examples of percentage readings converted to dBA.

In addition, Stewart made spot checks at each area at intervals during the day, using a General Radio Type II Sound Level Meter (Tr. 44, 54, 68).

Stewart testified that the dosimeter has an error factor of 30% in either direction, and that this amounts to 2 dB (Tr. 91). (30% does not necessarily equal 2 dB. See note 2.) A reading of 133.2% for location 8A3 could thus mean an actual noise level of 103.2%, or 90.2 dBA, and perhaps even less. Stewart conceded that this was "possibly" a borderline case (Tr. 91). In my view this reading is insufficient to establish exposure to sound in excess of the levels listed in Table G-16, and the charge will be ordered vacated with respect to the 8A3 vacuum cleaner and materials handling location.

---

2/ (continued)

| % noise exposure time (dosimeter data) | equivalent sound pressure level (dBA) | % noise exposure time | dBA |
|---|---|---|---|
| 100 | 90.0 | 119 | 91.3 |
| 101 | 90.1 | 120 | 91.3 |
| 102 | 90.1 | 125 | 91.6 |
| 103 | 90.2 | 130 | 91.9 |
| 104 | 90.3 | 135 | 92.2 |
| 105 | 90.4 | 140 | 92.4 |
| 106 | 90.4 | 145 | 92.7 |
| 107 | 90.5 | 150 | 92.9 |
| 108 | 90.6 | 155 | 93.2 |
| 109 | 90.6 | 160 | 93.4 |
| 110 | 90.7 | 165 | 93.6 |
| 111 | 90.8 | 170 | 93.8 |
| 112 | 90.8 | 175 | 94.0 |
| 113 | 90.9 | 180 | 94.2 |
| 114 | 90.9 | 185 | 94.4 |
| 115 | 91.0 | 190 | 94.6 |
| 116 | 91.1 | 195 | 94.8 |
| 117 | 91.1 | 200 | 95.0 |
| 118 | 91.2 | 210 | 95.4 |

As to location 26A3 the reading of 169.4% could mean 139.4%, or 92.4 dBA, taking into account the 30% error factor. Applying the error factor to the 7A3 location, it is possible that the actual noise level was 175.6%, or 94 dBA.

The sound levels registered by the dosimeters after the all-day studies on October 10, 1978, at locations 26A3 and 7A3 were higher than the levels allowed by the cited standard, and it is so found. However, merely establishing that Respondent's employees were exposed to excessive noise on October 10, 1978, is not enough to prove a violation of 29 CFR 1910.95(b)(1); Complainant is also required in the instant case to show that Respondent failed to utilize engineering or administrative controls which were technically and economically feasible. RMI Co. v. Secretary of Labor, 594 F.2d 566, 571-572 (6th Cir. 1979). Turner Co. v. Secretary of Labor and OSHRC, 561 F.2d 82, 83-84 (7th Cir. 1977). Secretary of Labor v. Continental Can Co., 1976-1977 OSHD para. 21,009 at p. 25,256; BNA 4 OSHC 1541, 1546; 76-3229 (9th Cir., filed October 19, 1976), pet'n for review withdrawn by Secretary of Labor.

According to Stewart, two routers were operating on October 10, 1978, and there was a third router not operating that day (Tr. 33, 52). Routing machines shape the wooden stocks of guns by drilling with a high speed bit (Tr. 31-32, Exh. C-2). He observed one Rye set machine operator at location 7A3 (Tr. 56-57). The employee actually runs wood stock through a series of four machines, each of which performs a separate operation (Tr. 57-60, 64-66, Exh. C-5). The Rye set machines included two routers (Tr. 525).

Stewart said that these four machines were "pretty much" in continuous motion (Tr. 67), and that three of the machines could be operating at the same time (Tr. 67-68).

To reduce the noise level to which Respondent's employees at location 26A3 were exposed Stewart recommended the installation of partial enclosures for the routing machines (Tr. 48-49). For the Rye set machines, he advocated enclosing portions of three of the four machines with sound-absorbing material (Tr. 73).

Stewart was employed for about one year at OSHA (Tr. 7), before leaving for employment in the private sector in January, 1979 (Tr. 77). He is not a member of the American Industrial Hygienist Association, and has no certification in industrial hygiene (Tr. 75). He had never seen routers or Rye set machines with the partial enclosures he recommended (Tr. 101, 104).

Ronald Morin, Supervisor of Industrial Hygienists at the Hartford OSHA office (Tr. 197), suggested partial enclosures for both the routers and the Rye set machines (Tr. 216, 228). Morin offered an alternative control for the Rye set machines: a transparent sound-reducing plastic curtain placed between the machine and the operator (Tr. 218-219, 223, Exh. C-12). The operator could move through the curtain by parting the overlapping sections (Tr. 223). Morin said that he spent a total of only about 40 minutes in examining these machines at Respondent's facility (Tr. 257-258). He is not board-certified in the field of noise (Tr. 249).

Morin estimated the total cost of the proposed enclosures for the three Rye set machines at $2,000 to $3,000, including labor and materials (Tr. 295),

and predicted a sound level reduction of at least 10 decibels (Tr. 216). For the alternative use of curtains, he estimated the cost at about $200 for the curtain material, plus $2.50 each for hanging fixtures (Tr. 225), and felt that this method would result in a reduction of "a good 12 decibels" (Tr. 222). He set the cost of a partial enclosure for the routers at $500 for a 10 decibel reduction (Tr. 232), and asserted that if he were the designer of the enclosure he would "realistically" expect a 25 decibel reduction (Tr. 232).

Respondent presented Dr. Paul Ostergaard, an acoustical engineer for the past 25 years (Tr. 323), who specializes in noise and noise control (Tr. 321). He spent four days at Respondent's plant studying the noise situation (Tr. 364), two days of which were devoted to the three locations listed in the citation (Tr. 365). In the 26A3 location he observed three routers in operation, with one operator running the three machines sequentially (Tr. 326). The machines were about five feet from each other (Tr. 327). He stated that he also observed the Rye set operation (Tr. 327-328), with one person operating the machines (Tr. 356). Dr. Ostergaard, who qualifies as an expert in acoustical engineering, opined that the most efficient engineering control for the Rye set machine is a full, rather than partial, enclosure (Tr. 330); that partial enclosures are impractical from a production standpoint because the machines are used for different operations, which require changes in machine configuration, and because partial enclosures must be sealed since even a small opening can reduce the effectiveness by 15 decibels (Tr. 334-335). He felt that the curtain method would not work (Tr. 336-337),

for the reason that the curtain material is not clear, and presents a distorted view to the employee (Tr. 337). This witness also recommended full enclosures for the routers for the same reasons he gave for selecting that type of engineering control for the Rye set machines (Tr. 351-352).

Dr. Ostergaard testified that based on estimates obtained from manufacturers and his own estimate of the cost of installing and maintaining the equipment (Tr. 353), he placed the cost of each full enclosure for a router at $8,615 (Exhs. R-5, R-11), and each full enclosure for a Rye machine at $7,255 (Exh. R-5). In his opinion a full enclosure would reduce the sound level by 20 to 25 decibels (Tr. 357).

On cross-examination Dr. Ostergaard conceded that the enclosures he recommended were "over-designed" for OSHA purposes (Tr. 389); that the cost of an enclosure could be reduced below the figures he had given (Tr. 382); and that he would be able to locate mufflers to be placed on the air nozzles on the routers so that the air noise (but not the woodcutting noise) could probably be reduced by 10 decibels, and that similar mufflers on the Rye set would reduce the air noise there (Tr. 389-390) by 10 decibels (Tr. 384-386), at a cost of about $100 for each muffler, including installation (Tr. 385-386).

One reason given by Dr. Ostergaard for his claim that a partial enclosure would be impractical for routers was that the machines require changes when used for different operations. However, that reason dissolves in the light of Respondent's foreman's testimony that such changes never require moving the "former box" on the machine more than one inch laterally (Tr. 530-531).

The admission by Dr. Ostergaard that his original estimated cost for full enclosures was excessive was followed by his concession that a combination of a partial enclosure and curtain in the back would suffice (Tr. 395-396), and that this measure would cost about $2,000 (Tr. 398) if installed by Respondent's employees (Tr. 397).

Stewart and Morin believed that partial enclosures for the machines would reduce the noise level within the limits set by the cited standard. Neither one qualifies as an expert in the field of noise control, whereas Dr. Ostergaard does. However, the latter's opinion that a partial enclosure would be impractical was based on an incorrect assumption that the routing machines underwent substantial modifications when switched from one operation to another. Also, Dr. Ostergaard expressed the view that the effectiveness of a partial enclosure can be reduced by as much as 15 decibels if not sealed properly; however, there is no reason to assume that the enclosures would be installed improperly. Upon consideration of the record in its entirety, I find that the weight of the evidence establishes that a partial sound-reducing enclosure constitutes a technologically feasible engineering control for the machines at locations 26A3 and 7A3.

As far as economic feasibility is concerned, the record offers estimates based on calculations made by Morin and Dr. Ostergaard. Morin estimated the necessary labor and materials for the partial enclosures for any of the machines at about $500 each (Tr. 232). Dr. Ostergaard originally placed the cost at about $7,200 to $8,600 for a full enclosure for each machine (Exhs. R-5, R-11), before dropping his estimate to about $2,000 for a partial

enclosure (Tr. 398). I find the estimate of about $2,000 per machine to be the most reliable in this record.

Stanley Sandquist, Respondent's Safety Engineer (Tr. 165) since September 1976 (Tr. 167), and an employee of Olin since 1940 (Tr. 504), testified that there are 26 routers and 26 Rye set machines in the Wood Shop at the New Haven plant (Tr. 505); that testing has disclosed that all the machines "are very close in noise reading" (Tr. 505-506); that the other routers are similar in operation to those cited and that the operations of the other Rye machines are similar to the cited Rye machines (Tr. 505).

Sandquist further testified that the cited routers are operated only about one week per month, or 25% of the time; that the rest of the time the employee "might be working on any of the other machine operations in that department" (Tr. 508); that the employee might be working on "another router" (Tr. 508-509). Sandquist's testimony was uncontroverted. Morin testified that he was told that the Rye set machines were used only three or four months out of the year (Tr. 300). Thus, in order to comply with the cited standard Respondent would have to install partial enclosures for 52 machines, at a total cost of about $100,000. In addition, there would be maintenance costs.

It was conceded by Stewart that personal protective equipment was worn by Respondent's employees on December 10 (Tr. 96). He claimed that on December 4, one employee, Abenante, was not wearing personal protective equipment (Tr. 46); and that he was told that Abenante did not normally work in that department (Tr. 83). However, Stewart's own notes covering that inspection

state that Stewart was told that Abenante was going to be there for only a few minutes (Tr. 83). I consider his notes on that point to be entitled to more weight than his testimony. It is clear that the OSHA officer did not ascertain that some employees worked at different machines, and was under the impression that Abenante always operated those machines at which he worked on December 10, at location 26A3.

Safety Engineer Sandquist asserted that the failure to wear ear protection results in disciplinary action at the plant, with a written warning for the first offense, suspension possibly for the second offense or even for a first offense if it was a serious infraction, and discharge the next time (Tr. 518-519).

Dr. Sorenson, Respondent's Medical Director, said that Respondent provides its employees with three types of ear plugs and an earmuff (Tr. 433); that employees are fitted for the device they are to wear (Tr. 438-439); that the employee is required to wear the protection if he is in a "hearing protection area" and annual audiograms are done on such employees (Tr. 431, 441); and that he has recommended that an employee no longer work in a high noise area when he had a hearing loss (Tr. 432). He further stated that he analyzed the audiograms of the employees working in the Wood Shop and found no evidence of harm resulting from their working there (Tr. 445).

The projected total expense of the hearing protections program for 1979 was about $14,000 (Exh. R-14). This included physician and nursing costs for audiograms, earplug costs, maintenance of equipment and other labor costs.

Dr. Ostergaard stated that the personal protective devices for the ear

reduce noise from 10 to 40 decibels, depending on the type; that one type of ear plug provided by Respondent reduces sound 20 to 25 decibels (Tr. 412-413).

I find that this record shows that Respondent has a good hearing protection program, which is mandatory and enforced by Respondent. Complainant contends that Stewart saw 15 to 20 persons working in the areas cited (brief, p. 19), but Stewart qualified this by saying that "there were some people working there that could be called borderline areas where the sound levels were lower" (Tr. 96). When Stewart spoke of the "area" he was so imprecise that it cannot be said with any degree of certainty how many, or if any, employees other than Abenante and Joshua were exposed to excessive sound levels. As far as this record is concerned, the expenditure of about $100,000 for partial enclosures would protect only those two named employees.

In light of all of the foregoing, I find that spending about $100,000 for partial enclosures for the machines is not warranted when the wearing of personal protection for the ears reduces the sound levels by 20 to 25 decibels.

It is found that Complainant has failed to show economically feasible engineering or administrative controls capable of substantially reducing the excessive sound levels at locations 26A3 and 7A3 at Respondent's New Haven facility. It is therefore concluded that on December 10, 1978, Respondent did not violate §5(a)(2) of the Act, 29 U.S.C. §654(a)(2), for noncompliance with the standard at 29 CFR 1910.95(b)(1). Nonserious Item 1 will be ordered vacated.

Item 2 of the nonserious citation, as amended, charges a violation of 29 CFR 1910.151(c) in that adequate eyewash facilities were not available to its employees.

The standard reads:

> Subpart K--Medical and First Aid
>
> §1910.151 Medical services and first aid.
>
> * * *
>
> (c) Where the eyes or body of any person may be exposed to injurious corrosive materials, suitable facilities for quick drenching or flushing of the eyes and body shall be provided within the work area for immediate emergency use.

On October 4, 1978, Stewart observed the strip room and the paint spray booth area (Tr. 12-13). In the spray booth area employees were exposed to the possibility of injurious chemicals splashing into their eyes (Tr. 13-14). At the time of the inspection Respondent had provided at each of the four spray booths a one-pint squeeze bottle containing an eyewash solution for emergency use (Tr. 14). Complainant contends that this did not meet the standard's requirement of "suitable facilities" because the manufacturers of chemicals used in the spray area advise in their literature to flush with copious quantities of water for 15 minutes if their products come in contact with an eye (Tr. 17, 478-479). Complainant is of the view that Respondent was required to provide a 15-minute supply of water, which could have been accomplished either by installing a connection to the city water line for running water, with one connection at each spray booth, or by placing in the area a number of portable containers filled with sufficient water (Tr. 27-28). The OSHA inspecting officer estimated that the one-pint bottles of eyewash provided at the time of the inspection could flush the eye for only five minutes (Tr. 15) instead of the 15 minutes recommended by the manufacturer.

Stewart conceded that city water can contain sediment (Tr. 81).

Supervisor Morin testified that an immediate eye flush for a minimum of 15 minutes was necessary, based on material data safety sheets put out by manufacturers of chemicals, the National Safety Council, the Red Cross, multi-media training courses, and "many, many doctors" he had encountered (Tr. 241-242). Later, Morin stated that an even better method of treatment would be to have a doctor treat the patient after a 10-minute flush (Tr. 244).

Dr. Sorenson did his residency for two years in the combined fields of neurology and ophthalmology at the Medical University of South Carolina (Tr. 418). He testified that the polyethylene bottles containing eyewash were preferable to a water installation or station for several reasons. One, making the bottles available takes less time than installing plumbing; two, the bottles are placed closer to the operator; three, the eyewash solution is guaranteed sterile, it is a balanced salt solution, and it contains substances which neutralize an alkali or caustic. He asserted that plain water was not as effective as the eyewash solution (Tr. 423-424), and that the solution was sufficient to protect the employees from the substances used in the spray area (Tr. 477).

According to Dr. Sorenson, when the spray booth is in operation he, or a nurse trained in the treatment of eye injuries, is always available at the plant to treat such injuries (Tr. 424-426); there is nursing coverage daily from 6:30 a.m., to midnight (Tr. 425). He said that he has four part-time doctors and a doctor associate on his staff (Tr. 473).

This witness also noted that when one places the eye in an eyewash

fountain and sprays water at it the reflex action is to close the eyelids, but the eyewash bottle has a flange on its mouth that assists in holding the eyelids in a retracted position (Tr. 426-427). In addition, the bottle is designed to let out a soft, broad spray rather than a narrow, projected one (Tr. 426-427).

Dr. Sorenson further testified that the plant Medical Department is about 120 yards from the cited area; that the liquid in the eyewash bottle would flush until the injured employee could be assisted to the Medical Department; that the employee would be transported to the medical area; that it takes only 30 seconds for an ambulance to respond to a call; that the ambulance is in a garage immediately behind the Medical Department, and a driver is always right there (Tr. 476-477, 484).

After the inspection and prior to trial Respondent installed water stations (eyewash fountains) in the cited area (Tr. 480-481).

As relevant here, 29 CFR 1910.151(c) mandates "suitable facilities" within the work area for quick flushing of the eyes in the event of an emergency. Complainant claims that Respondent failed to comply because it provided only a 5-minute flush whereas the record shows that doctors, authorities on first aid, and manufacturers of chemicals which can be injurious to the eyes recommend a 15-minute flush with water. However, such recommendation does not necessarily mean that this is the only or the best practice to follow in every situation. Respondent's squeeze bottles filled with an eyewash solution may have permitted only a 5-minute flush, but this record shows that four bottles were available in the work area, the solution

was sterile but the local water was not, the solution was better suited than water to protect the employees because only the solution contained substances needed to neutralize the injurious chemicals used in the area, and in addition, an injured employee could be reached by ambulance within 30 seconds, brought to the Medical Department only 120 yards away, and treated by a doctor or nurse. Based on these facts, I find that Respondent provided better protection than a 15-minute water flush, and did in fact provide its employees with suitable facilities within the contemplation of the cited standard. The charge has not been established, and this item will be ordered vacated.

Accordingly, it is ordered that serious Item 1 be affirmed and a penalty of $320 assessed, and that Items 1 and 2 of the amended nonserious citation be vacated.

DECISION

WORCESTER, Judge:

On April 20, 1979, the Secretary of Labor's Occupational Safety and Health Administration (OSHA) office in Waltham, Massachusetts, was informed that there had been a fatal accident at the site of a sewer construction project in Peabody, Massachusetts. Two compliance officers and a civil engineer were sent to the site and, after their inspection was completed, two citations were issued alleging that the Respondent, J.T.C. Construction Co., Inc. (JTC), had violated regulations promulgated by the Secretary pursuant to the authority granted him by the Occupational Safety and Health Act of 1970 (29 U.S.C.A.

§651 et seq., hereinafter called the Act). The Secretary recommended that a total penalty of $5,280 be assessed.

The jurisdiction of this Commission and of JTC as an employer subject to the provisions of the Act and the regulations promulgated by the Secretary is established.

The evidence revealed that two laborers and a foreman, O'Maley, were at the worksite. They were preparing to install sewer pipe in a trench which was more than 86 feet long, more than five feet wide and 7 1/2 to 8 feet deep (Tr. 33, 41). One of the laborers, Mark Stamitas, testified at the hearing. The other laborer, Albert Smart, was killed in the collapse of the wall of the trench. O'Maley, because he is now employed by another contractor, was temporarily absent from the vicinity on the trial date (Tr. 90), but there is no evidence showing that his testimony could not have been offered.

Stamitas, the surviving laborer, said that when the backhoe struck a rock ledge at the bottom of the trench that he and Smart went into the trench to clear it off so it could be blasted (Tr. 9, 10). JTC's general manager, Cristaldi, said that he had visited the jobsite about an hour before the cave-in. He discussed the situation with O'Maley and it was decided to just prepare for blasting. He said that the two laborers would not have been required to enter the trench in order to do that (Tr. 91-95).

The evidence is clear, unambiguous, and in most instances, not in dispute. In Citation No. 1 JTC is alleged to have failed to give its employees safety training in violation of 29 CFR §1926.21(b)(2). The Secretary, who has the burden of proof, neglected to introduce any evidence showing what training

should have been given. A common laborer is an unskilled worker who needs close supervision and direction as he works. There is no basis upon which it could be concluded that the fatal accident was due to lack of training. The Secretary concedes this when he says that the sole cause of the tragedy was the act of the foreman who "oblivious to the hazards..." (Brief p. 5) ordered the two laborers to enter the unshored trench. Assuming without deciding that this was the case, it is plain to be seen that inadequate training had nothing to do with the two employees being in a place of danger. For that reason Citation No. 1 and the $480 proposed penalty must be vacated.

In Citation No. 2 JTC is alleged to have violated 1926.652(b) by failing to shore sheet, brace or slope the sides of a trench. A penalty of $4,800 was recommended on the ground that this was a willful violation. The weight of authority is that a willful violation is one in which the conduct of the employer amounts to a "...conscious, intentional, deliberate, voluntary..." act. Kent Knowlin Construction Co. v. Secretary, 593 F.2d 368 (10th Cir. 1979); F.X. Messina Construction Corp. v. Secretary, 505 F.2d 701 (1st Cir. 1974).

JTC's superintendent who had viewed the site shortly before the accident said that the entrance of the laborers into the trench was neither required nor in accordance with his instructions (Tr. 91). The laborer said that O'Maley did not "...come right out and tell anybody specifically (to enter the trench)..." (Tr. 9). The Secretary has failed to sustain the burden of proof of willful violation.

## CONCLUSIONS OF LAW

1. In the absence of affirmative proof by the moving party, the Secretary, that a construction laborer working in a trench in the presence of a civil engineer supervisor needed special training and instruction, Citation No. 1 alleging violation of 29 CFR §1926.21(b)(2) must be vacated.

2. The undisputed evidence shows that the hole in the ground was a trench as defined by the regulations and that its vertical walls were composed of unstable soil. The fact that there was a cave-in shows conclusively that, in the terminology of tort law, it was a res ipsa loquitur case of instability. However, it does not follow that there was a violation of 29 CFR §1926.652(b), willful or serious. Ocean Electric Corporation v. Secretary, 594 F.2d 396 (4th Cir. 1979); Floyd S. Pike Electrical Contractor, Inc. v. Secretary, 557 F.2d 1045 (4th Cir. 1977); Horne Plumbing & Heating Company v. Secretary, 528 F.2d 564 (5th Cir. 1976); and National Realty Company, Inc. v. Secretary, 489 F.2d 1257 (DC Cir. 1973).

3. Although I have previously taken the position that an employer should be held accountable for the consequences of the acts of supervisory personnel the same as under the doctrine of respondent superior in tort law, see Secretary v. Ocean Electric Corp., OSHRC No. 5811, para. 22466 CCH OSHD (Aug. 9, 1974), the courts have rejected this view, see Ocean Electric Corporation v. Secretary, (and other citations supra). Unlike Ocean Electric where it was stipulated that a foreman had ordered an apprentice into a place of danger where he was electrocuted, JTC disputes the allegation that employees were ordered into a hazardous area by a supervisor. In the

absence of a stipulation as in Ocean Electric and upon consideration of Cristaldi's unrebutted testimony that the two men were in the trench contrary to his specific instructions, it must be concluded as a matter of law that the incident was unforeseeable and that there was no violation of §652(b).

ORDER

It is therefore hereby ordered that Citations 1 and 2 and the proposed penalties be vacated and that this proceeding be dismissed.

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

---

RAYMOND J. DONOVAN, SECRETARY OF LABOR,

Complainant,

v.

OSHRC DOCKET
No. 79-2455

J.T.C. CONSTRUCTION COMPANY, INC.,

Respondent.

---

STIPULATION AND SETTLEMENT AGREEMENT

I.

The parties hereby enter into this stipulation and settlement agreement as full and complete settlement of the instant case which is presently pending before the Occupational Safety and Health Review Commission (hereinafter "the Commission").

II.

The parties stipulate as follows:

(A) The Commission has jurisdiction of this matter purusant to section 10(c) of the Occupational Safety and Health Act of 1970 (84 Stat. 1590, 29 U.S.C. §651 et. seq.) (hereinafter "the Act").

(B) Respondent, J.T.C. Construction Company, Inc., is a corporation with an office and place of business located in North Andover, Massachusetts, and is engaged in the operation of a construction business. During the course of its business, Respondent uses equipment and material from places

located outside the State of Massachusetts. Respondent was and is an employer engaged in a business affecting interstate commerce within the meaning of sections 3(3) and 3(5) of the Act and employed employees within the meaning of section 3(6) of the Act.

(C) As a result of an inspection conducted on April 20-24, 1979, at respondent's worksite located at Centennial Industrial Park, Fourth Street, Peabody, Massachusetts, two citations and notifications of proposed penalty were issued to respondent on April 27, 1979, by certified mail, return receipt requested, pursuant to Sections 9(a) and 10(a) of the Act, to wit:

> (1) Citation No. 1 alleging one item of serious violation of the standard set forth at 29 CFR 1926.21(b)(2) and proposing a penalty of $480; and
>
> (2) Citation No. 2 alleging one item of willful violation of the standard set forth at 29 CFR 1926.652(b) and proposing a penalty of $4800.

(D) By letter dated May 4, 1979, respondent timely contested the citations and proposed penalties. The notice of contest was duly transmitted to the Commission.

(E) Following the timely filing of a complaint and answer, this matter came to hearing on November 20, 1979, before an administrative law of the Commission.

(F) On February 4, 1980, the administrative law judge issued his decision and order in which he vacated the citations and the penalties proposed therefore.

(G) On February 28, 1980, the Secretary filed a petition for discretionary review. On March 5, 1980, Commissioner Bertram Robert Cottine directed the case for review.

(H) On September 24, 1982, the Secretary filed a motion for suspension of briefing schedule in order to execute this stipulation and settlement agreement.

III.

Complainant hereby agrees to amend Citation No. 2 for willful violation to allege a serious violation of the cited standard and to reduce the proposed penalty to $900.00. Complainant further agrees reduce to $100.00 the penalty proposed for citation No. 1.

IV.

Respondent hereby agrees to withdraw its notice of contest of the citations and penalties proposed therefor, as amended above, states that it has abated the violations set forth in the citations, and agrees to pay the amended proposed penalty of $1000.00 within fifteen (15) days from the filing of this stipulation and settlement agreement with the Commission.

V.

Complainant and respondent hereby agree to bear their own fees and other expenses incurred by them in connection with any stage of this proceeding.

VI.

Respondent certifies that on 11/10/82, 1982, it posted this stipulation and settlement agreement in accordance with Commission Rule 7.

VII.

Except for this matter between the Secretary and respondent, and except for the issuance by the Secretary of a notification of failure to correct these alleged violations or any other subsequent OSHA proceeding between the Secretary and respondent, none of the foregoing agreements, statements, findings and actions taken by respondent shall be deemed an admission by respondent of the allegations contained within the citations and notifications of proposed penalty or the complaint. The agreements, statements, findings and actions taken by respondent herein are made only for the purpose of compromising and settling this matter economically and amicably, and they should not be used for any other purpose, except as herein stated.

VIII.

Upon approval of this agreement by the Commission, the agreement shall constitute a final order of the Commission.

WHEREFORE, the Secretary and Respondent request the Commission to approve this stipulation and settlement agreement.

FOR THE COMPLAINANT

FOR THE RESPONEDNT

| SECRETARY OF LABOR,<br>Complainant<br>v.<br>ANTONIO LEVESQUE & SONS, INC.,<br>Respondent | OSHRC DOCKET NO. 82-578 |

APPEARANCES:

Ronald Glover, Esq., for Complainant

Gerald E. Rudman and Philip D. Buckley, Esqs., for Respondent

DECISION AND ORDER

This case arose under 29 USC, sec. 651 et seq. of the Occupational Safety and Health Act of 1970 (the Act). As a result of an inspection by the Occupational Safety and Health Administration (OSHA) of the Respondent's premises on or about February 23 - March 26, 1982, Citation #1 was issued on or about May 17, 1982, charging that the Respondent violated sec. 5(a)(2) of the Act by the serious violation of the standard at 29 CFR 1910.266(e)(2)(i) in that the Respondent did not instruct fellers engaged in pulpwood harvesting to plan a retreat path and clear a path as necessary before the cut was started.

On or about May 27, 1982, the Respondent filed Notice of Contest to the Citation and the penalty proposed therefor.

The pertinent sections of the Act and the standards concerned are appended to this decision under appropriate titles.

## PRELIMINARY

In the course of its business, the Respondent operated a sawmill to which it brings lumber from trees felled by its employees at various forests, including the worksite in question. The lumber is processed into boards of various lengths, saw-logs, chips, pulpwood, and other products that customers have previously ordered or purchased on sight.

The worksite was a stand of trees near the Respondent's camp at McNally Pond. The trees, which were in snow 36 - 39 inches deep, were in "compartments" about 600 - 1500 feet along the roadway and 1500 - 2000 feet perpendicular from the road to the rear. The Respondent's employees worked in groups of two, consisting of a "skidder" and a "chopper". The skidder operates tree-hauling equipment that drags the tree after the chopper has felled it with a chain-saw. The chopper puts cuts in the tree at places he believes will make the tree fall in a determined direction. The retreat path is intended to be a safe area for the chopper.

## THE ISSUES

1. Was the Respondent engaged in a pulpwood logging operation?

2. Had the fellers been instructed to plan a retreat path, and clear it, before the cut was started?

3. Were conditions at the worksite such that it was necessary to clear a retreat path?

## .266(e)(2)(i)

The testimony offered by both parties clearly established that employees had not been instructed to plan a retreat path of any kind. The fellers themselves [Yves Levesque, Roland Levesque, Sylvain, and Marquis], who all impressed me as honest, hard-working people, so testified...Tr. 162, 170, 176, 178, 179, 185.

The Respondent's logging supervisor [Tardie], who also impressed me as an honest, hard-working man, so testified...Tr. 200, 201, 267. Since I not only believe those witnesses but there was no testimony to contradict them, I find that fellers had not been instructed to plan a retreat path or clear it.

A question of interpretation arises because of the wording of the standard: "The feller shall be instructed to plan retreat path and clear path as necessary...". Do the words "as necessary" modify the clause "shall be instructed" or the clause "clear path" or both? In my opinion, they modify only the clause "clear path". However, if they modify both clauses, the facts in the instant case establish that it was "necessary" to instruct the fellers to plan a retreat path because there was a danger of a tree falling in an unintended fashion, and the feller had not planned a retreat path of any kind. And, if a retreat path had been planned [e.g., the footprints leading to the tree], it certainly had not been cleared, which was necessary because of the depth of the snow. Consequently, regardless of what interpretation is given to the words "as necessary", a violation of the standard has been established.

Would the Respondent be excused from "instructing" the employees simply because they were skilled workers who should themselves have known what safety precautions to take? The law is clear that the employer cannot shift such a responsibility to the employees. The standard here specifically states that the feller "shall" be instructed. Moreover, the interpretation given an analogous standard [the general safety standard, 29 CFR 1926.21(b)(2)] is to the same effect. That standard's specific words "shall instruct each employee" have been construed on several occasions. For example, in the Pohl case [7 OSHC 1483] the Administrative Law Judge held that compliance with the standard at 29 CFR 1926.21(b)(2) required instructions beyond the scope covered in a general safety program. In the Cleveland Wrecking Company case

[6 OSHC 1821], where the Respondent hired only experienced demolition men, the Administrative Law Judge ruled that experience cannot be substituted for the safety instruction mandated by the standard at .21(b)(2). It was also pointed out that the veteran employee may be imperilled by complacency. In the National Industrial case [6 OSHC 1914] the 8th Circuit Court of Appeals held that compliance with .21(b)(2) requires more than a general safety program, especially for new employees.

The cases make it clear that if the proper instructions are not given [where the standard says "shall instruct"], regardless of the reason for failing to do so, it is a violation of the standard. That is because it is not only salutary to remind the employee of the hazard but also it may result in greater care being taken by an employee who is made aware of the fact that the employer is insisting that precautionary measures be followed.

There was testimony from which it might be argued that the workers' footsteps to the tree might constitute a "path". Assuming such an inference were possible, certainly such a path was not cleared "as necessary" where the snow was 36 - 39 inches deep and, for most of the employees, was either waist high or chest high according to the testimony of all the witnesses for both parties... Tr. 17, 155, 162, 164, 177, 185, 201. Such footsteps in the snow would not constitute a "clear" path.

I find that no path was cleared as was necessary under the conditions at the worksite.

## HAZARD

The hazard of not having a retreat path planned and cleared was that, if the tree did not fall in the intended direction, the employee might be seriously injured or killed if it fell on him...Tr. 58 - 60.

All the witnesses agreed that trees do not always fall in the intended direction. It was clearly established that it was not unusual for an employee to be injured by the limb or trunk of a felled tree or by some part of another tree. In fact, two of the witnesses had themselves been struck by falling trees...Tr. 159, 160, 167. The Respondent's logging supervisor testified that working among large trees is unsafe...Tr. 241. And the testimony of the Respondent's expert also tended to establish the hazardous nature of tree felling...Tr. 105, 106, 111.

Although the hazard to the tree-feller is the same whether the lumber is eventually processed into pulpwood or one of the other products [e.g., saw-logs], the standard nevertheless protects only those employees who fell trees that are destined for the pulpwood industry. That is the anomalous result of its wording even though the time, place, and methods of felling two identical trees are exactly the same in every aspect except the ultimate use of the processed lumber. As pointed out in the uncontradicted testimony of the expert, Rolston [Tr. 80, 81, 88], that result apparently was intended by those who drew up the ANSI standard. In any event, whether intended or unintended, the unambiguous words of the standard mandate such a distinction based on the ultimate product processed from the tree.

KNOWLEDGE

Supervisory personnel of the Respondent were on the worksite frequently, were completely familiar with conditions there, and knew that there had been no specific instruction given to employees on planning or clearing a retreat path. Moreover, there had been previous incidents where trees fell and hit or narrowly missed employees...Tr. 157, 246, 264, 267, 274.

I find that the Respondent knew, or should have known, of the hazardous

conditions.

.266(a)

The Respondent contended that the standard at .266(e)(2)(i) did not apply to it because its operation at the worksite related to saw-logs, which is exempted by the standard at 29 CFR 1910.266(a).

The standard at .266(e)(2)(i) specifically applies to "pulpwood logging operations" and specifically excludes "logging operations relating to saw-logs".

The evidence tended to establish that the major portion of the Respondent's operation had to do with pulpwood. As explained by the expert [Rolston], there is a difference in the way the tree is cut when it's related to saw-wood logging as distinguished from pulpwood purposes. For saw-logging, it is important to have a cut parallel to the ground so that the end is square cut; and that is not of such concern in pulpwood logging. He also said that a larger tree is preferred for saw timber than for pulpwood. He explained that it does not matter if the bottom of the tree is split in pulpwood logging whereas in hardwood logging that might reduce the board length by a couple of feet.

As he testified: In saw-log logging it is important "to be very careful that the butt of the log is in good shape...have to take good care that your cuts are relatively parallel to the ground so that you get a good square cut on the end...this is very important in utilization at the mill...so, the feller has to be more careful in cutting saw timber than he does in pulpwood logging..." He also pointed out that the feller is "dealing with generally a larger tree for utilization of saw timber than for pulpwood."...Tr. 91, 92.

Yet the chopper Levesque testified without contradiction that his boss never suggested how to make a cut and he was given no instructions about how the bottom end of the stump should look...Tr. 165, 174. While that evidence is

not conclusive, of course, it is more consistent with a finding that it was a pulpwood operation than a saw-log one.

The same conclusion is true of Levesque's testimony that some of the trees felled were only 5, 6, 8, and 10 inches in circumference...Tr. 165. It is not likely that such small trees were felled for saw lumber.

I was very favorably impressed with the qualifications and honesty of the Compliance Officer [Cyr]. He testified that the Respondent's personnel director [Caron] said that the Respondent was harvesting pulpwood; that, while some of the wood was for saw-logs, the majority was being used to make chips for pulpwood; and that the main body of the wood was being used for pulp or chips to be sold as pulp...Tr. 46, 125, 150. He also testified that trucks at the jobsite were hauling full tree lengths, a common method of transporting pulpwood... Tr. 124.

Although Caron testified that only "some of the waste product lumber...was converted into chips", he did not specifically deny the Compliance Officer's statement of the conversation...Tr. 281.

The Respondent's employee [Marquis] testified that the Respondent's logging supervisor [Tardie] told him the Respondent had a contract to sell chips to the Fraser Company, and had so many thousand cords to cut...Tr. 186, 187. The employees' union representative [Trepanier] testified that the Respondent's logging supervisor told him the same thing, and that that was the only thing keeping the Respondent operating because saw-logs were not selling...Tr. 193. Those statements of Marquis and Trepanier were not contradicted or denied by the Respondent.

The Respondent's logging supervisor [Tardie] testified that the lumber was not being harvested for pulpwood...Tr. 205, 206. However, he made several other

statements that would tend to contradict that conclusion. He said that, before work was begun at the McNally Pond worksite, the Respondent advertised for laborers at pulpwood rates...Tr. 199, 200. He also said that the Respondent had a contract with the Fraser Paper firm to provide it with chips...Tr. 204. He estimated that 10 - 15 percent, or at least 10 percent, of the roundwood would end up in the pulp process...Tr. 249, 250.

On all the evidence, it seems clear that the Respondent was engaged, at least to some degree, in pulpwood logging. However, the question still arises: what is the standard's application when the operation relates in part to pulpwood logging (where the language of the standard is that it applies) and in part to saw-logs (which is exempted)?

In my opinion, no reasonable interpretation of the standard would require that the operation be solely and exclusively pulpwood logging; if that were not so, a Respondent could avoid its consequences merely by having some slight percentage [e.g., 1%] of the process be in other than pulpwood. Certainly no legislative body would have intended such an unreasonable result. Having in mind that the purpose of the law is to protect employees, the standard should be interpreted to apply if a significant part of the operation was in pulpwood logging. Here, what part of the operation was in pulpwood? And was that part "significant"?

While the evidence is not overwhelming, a clear preponderance of it leads to the conclusion that at least some part of the Respondent's operation constituted "pulpwood logging". No one bit of evidence in itself would establish that conclusion — but the sum total of various items do so. They include the above specified admissions attributed to the Respondent's personnel director and logging supervisor, the trucks hauling full tree lengths, the contract with Fraser Paper,

the advertisements relating to pulpwood rates, the felling of small circumference trees, the lack of instructions to fellers to cut parallel to the ground, and other evidence of facts more consistent with pulpwood logging than saw-logging. I find that the evidence has established that the logging operation at McNally Pond was primarily, substantially, and significantly [if not completely] related to pulpwood; and that the standard cited applies.

CONTINUANCE?

At the hearing, the parties were advised that, if the Complainant requested time to meet any evidence offered by the Respondent to support its motion to strike or defense based on the standard at 29 CFR 1910.266(a), such time would be granted. No such continuance was ever requested.

ALTERNATE FINDING

If upon review it be decided that pulpwood logging at the jobsite related to no more than 10% of the Respondent's operation [in keeping with the testimony of the Respondent's logging supervisor at Tr. 250], I find that that would be such a significant part of the Respondent's operation that the standard cited applies.

MOTIONS

The Respondent's motion to dismiss the Complaint for failure to state a claim, which was filed at the hearing and renewed in its brief, is denied for the reasons stated above under the topic entitled ".266(a)".

The Respondent's motion to dismiss the Complaint because the Complainant did not timely comply with the order to furnish it with a list of witnesses was denied...Tr. 5-7. The Respondent was advised that, if it felt prejudiced in any way because of the delay, any request by it for additional time would be granted. No request was ever made.

## FINDINGS OF FACT

Having heard the testimony, observed the witnesses, and examined the exhibits, the following Findings of Fact are made:

1. At all times concerned, the Respondent regularly received, handled or worked with goods which had moved across state lines.

2. As concerns Citation #1, the Respondent's employees were not instructed to plan a retreat path or clear it as necessary before starting a cut in trees.

3. The snow at the jobsite was 36 - 39 inches in depth and footsteps in it did not constitute an adequate path.

4. A significant part of the work at the jobsite was related to pulpwood logging.

5. The conditions described in Citation #1 exposed the Respondent's employees to sustaining serious or fatal harm because of the hazard of a tree falling on the feller.

6. One or more officers or supervisory personnel of the Respondent knew of the hazardous conditions described herein and knew that employees were exposed to such hazard.

## CONCLUSIONS OF LAW

1. At all times concerned, the Respondent was an employer engaged in a business affecting commerce within the meaning of the Act; and the Occupational Safety and Health Review Commission has jurisdiction over the subject matter and the parties.

2. At all times concerned, the Respondent knew, or with the exercise of due diligence should have know, of the alleged violation.

3. On the date in question, the Respondent was not in compliance with the standard at 29 CFR 1910.266(e)(2)(i), and the Complainant has sustained the

burden of proving the Respondent violated sec. 5(a)(2) of the Act (sec. 654).

**ORDER**

The whole record having been considered, and due consideration having been given to 29 U.S.C. sec. 666(j), it is ordered:

1. Citation #1 is affirmed and a penalty of $315 assessed therefor.

SO ORDERED.

Foster Furcolo

FOSTER FURCOLO
JUDGE, OSHRC

Dated: November 22, 1982
Boston, Massachusetts

## APPENDIX

## THE ACT

Section 654 [section 5(a)(2)] Employer "...shall comply with occupational safety and health standards..."

Section 666 [section 17(b)] "...employer who has received a citation for a serious violation...of this Act...shall be assessed a civil penalty of up to $1,000 for each such violation."

Section 666 [section 17(j)] "...assess all civil penalties...giving due consideration to...the size of the business...gravity of the violation, the good faith of the employer, and the history of previous violations."

Section 666 [section 17(k)] "...a serious violation shall be deemed to exist...if there is a substantial probability that death or serious physical harm could result...unless the employer did not, and could not...know of the presence of the violation."

## THE STANDARDS

29 CFR 1910.266(a): "This section applies to pulpwood logging operations including but not limited to the operations of felling...and other operations associated with the preparation and movement of pulpwood timber from the stump to the point of delivery. The provisions of this section do not apply to logging operations relating to saw-logs..."

29 CFR 1910.266(e)(2)(i): "The feller shall be instructed to plan retreat path and clear path as necessary before cut is started."

| Respondent. | : | |
| ATLANTA WEB PRESSMEN UNION LOCAL 10, | : | |
| Authorized Employee Representative. | : | |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

The issue in this case is whether Respondent, Cox Enterprises, Inc., d/b/a Atlanta Newspapers ("Cox"), failed to abate a violation of the noise standard at 29 C.F.R. § 1910.95(b)(1).[1/] Resolution of that issue turns

---

1/ 29 C.F.R. § 1910.95(b)(1) provides:

§ 1910.95 Occupational noise exposure.

* * *

(b)(1) When employees are subjected to sound exceeding those listed in Table G-16, feasible administrative or engineering controls shall be utilized. If such controls fail to reduce sound levels within the levels of Table G-16, personal protective equipment shall be provided

(continued on next page)

on whether engineering controls beyond those Cox had implemented were feasible. Administrative Law Judge John S. Patton found that the Secretary failed to prove the feasibility of additional controls and vacated the failure to abate notification. We set aside his decision and remand for further proceedings.

I

Cox publishes the major morning and afternoon newspapers in Atlanta, Georgia, the Atlanta Constitution and the Atlanta Journal, and a combined Sunday edition, the Journal-Constitution. On August 23, 1972, the Secretary

---

1/ (continued)

and used to reduce sound levels within the levels of the table.

* * *

TABLE G-16—PERMISSIBLE NOISE EXPOSURES[1]

| Duration per day, hours | Sound level dBA slow response |
|---|---|
| 8 | 90 |
| 6 | 92 |
| 4 | 95 |
| 3 | 97 |
| 2 | 100 |
| 1-1/2 | 102 |
| 1 | 105 |
| 1/2 | 110 |
| 1/4 or less | 115 |

[1] When the daily noise exposure is composed of two or more periods of noise exposure of different levels, their combined effect should be considered, rather than the individual effect of each. If the sum of the following fractions: $C_1/T_1 + C_2/T_2$ $C_n/T_n$ exceeds unity, then, the mixed exposure should be considered to exceed the limit value. $C_n$ indicates the total time of exposure at a specified noise level, and $T_n$ indicates the total time of exposure permitted at that level.

Exposure to impulsive or impact noise should not exceed 140 dBA peak sound pressure level.

of Labor ("Secretary") issued a citation to Cox pursuant to section 9(a), 29 U.S.C. § 658(a), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). The citation alleged that Cox violated section 1910.95(b)(1) by failing to implement feasible administrative or engineering controls when sound levels exceeded those listed in Table G-16 of the standard. The citation required that the violation be corrected by August 2, 1973. Cox did not contest the citation, and it therefore became a final order of the Commission pursuant to section 10(a) of the Act, 29 U.S.C. § 659(a). Cox was subsequently granted extensions of the abatement date to November 4, 1974. On December 4, 1974, the Secretary conducted a follow-up inspection at Cox's worksite. As a result of this reinspection, Cox was issued a notification of failure to correct the violation pursuant to section 10(b) of the Act, 29 U.S.C. § 659(b). Cox's contest of the failure to abate notification is now before the Commission. Cox concedes that excessive noise continued to exist at its worksite after the final abatement date of November 4, 1974, but contends that it complied with the citation by installing all feasible engineering and administrative controls to reduce the noise exposure of its employees.

This case involves the noise generated by Cox's printing presses. In Cox's press room are six presses, each consisting of a number of printing units and a folder. When a press is operating, the noise level at the folder of that press is 106-107 dBA. Cox's pressmen have various duties to perform while the presses are running that require their presence at the folder, and they are therefore exposed to these high noise levels. The

pressmen also have other duties to perform in the press room and reel room[2/] at locations where the noise levels are lower than at the folder, but still in excess of 90 dBA.

On a normal day, Cox employs two shifts of pressmen: a night shift to print the next day's Constitution, and a day shift to print that day's Journal. Each shift lasts 7 1/2 hours, but the presses do not run during an entire shift. During a shift, the pressmen work in crews containing at least three members, and the crew members rotate at the presses at 30 minute intervals. Thus, an individual pressman will work a 30 minute period and will then have no duties to perform for at least an hour. It is not unusual for an individual pressman to work consecutive night and day shifts, and a pressman will sometimes work three consecutive shifts. Additional shifts are sometimes added, particularly on Thursdays and Saturdays when certain sections of the Sunday paper are printed. These additional shifts, however, occur during the same time periods as the regular shifts on these days and are manned by different crews than those working the regular shifts. On Saturdays, when the Sunday paper is being printed, a shift will sometimes exceed 7-1/2 hours.

After receiving the original citation, Cox assigned Robert Simonton, its Director of Personnel, and Glenn Elvidge, its Director of Engineering and Production, the task of bringing the company into compliance with the

---

2/ The printing presses are fed newsprint from large reels located underneath the presses. The area in which the reels are located is called the reel room. The reel room and press room, however, are not two distinct rooms, but are sections of a large open area. The same employees work in the reel room as the press room. Moreover, the main noise sources in the reel room are the printing presses, and controls that would reduce noise in the press room would also reduce the noise levels in the reel room. Accordingly, in our subsequent discussion, our references to the press room will also include the area called the reel room.

noise standard. Simonton and Elvidge concluded that, because of the unpredictable duration of any individual pressman's noise exposure during a working day, the only way to achieve full compliance with the standard was to reduce the noise level in the press room to less than 90 dBA. With this objective in mind, they contacted various consultants and investigated what other newspapers had done to control excessive noise.

At the printing facility of the Dayton Daily News, another newspaper in Cox's chain, Simonton and Elvidge observed an acoustical folder enclosure in use. The enclosure reduced the noise level by 7 dBA, but the noise level outside the folder was still 100 to 101 dBA. They also observed a Wall Street Journal printing plant in New Brunswick, New Jersey, in which a wall-type barrier had been erected between the presses and the employees. They determined that the noise level outside the barrier was 96 dBA. Elvidge also contacted the manufacturer of its presses, MGD Graphics Systems, known in the trade as "Goss." He learned that Goss had commercially available a folder enclosure that would produce a 10 dBA reduction in the noise level at the folder.

One of the consultants Simonton and Elvidge contacted, M.J. Kodaras and Associates, performed a study of Cox's press room and concluded that there was no feasible means of achieving compliance with the standard short of redesigning the equipment in the room. Two other consultants made recommendations which Simonton and Elvidge found to be unsatisfactory, but they did not elaborate on their reasons for reaching that conclusion. Simonton and Elvidge ultimately concluded that it was impossible to achieve a noise level of less than 90 dBA at the folders of its presses. They therefore determined that the best approach was to isolate the employees from the noise during the periods when the employees had no duties to

perform at the presses rather than to attempt to eliminate the sources of noise. A company called Noise Abatement Systems offered to build quiet rooms within the press room and guaranteed that the noise level within the quiet rooms would be less than 90 dBA. Cox contracted to have three such quiet rooms built at a cost of $110,000. When completed, the noise level within the quiet rooms was between 82 and 85 dBA. Thus, when pressmen were not working at the presses during their 30 minute rotations, they could enter a quiet room in which the noise level was less than 90 dBA. However, while outside the quiet rooms, pressmen were still exposed to noise in excess of the levels permitted by the standard.[3/]

II

Much of the evidence and argument presented to the judge concerned whether engineering controls were available to Cox to reduce the noise level in its press room to less than 90 dBA.[4/] In vacating the failure to abate notification, the judge found that although "[a] substantial reduction in noise can be accomplished" by use of engineering controls, the Secretary had not proven that such controls were available to reduce

---

3/ The parties stipulated that Cox provided personal hearing protection equipment to its employees and required that such equipment be used whenever an employee was in the press room. However, the provision and use of personal protective equipment does not diminish an employer's responsibility under the standard to implement whatever engineering or administrative controls are feasible to reduce noise levels. See Turner Co., 76 OSAHRC 108/A2, 4 BNA OSHC 1554, 1976-77 CCH OSHD ¶ 21,023 (No. 3635, 1976), rev'd on other grounds, 561 F.2d 82 (7th Cir. 1977).

4/ The Secretary argued that it was not necessary for controls to achieve Table G-16 levels in order to be feasible but that, in any event, he had proven that Cox could have achieved G-16 levels. Cox argued that it could not have achieved G-16 levels and that controls were therefore not feasible.

noise to that permitted by the standard.[5/] Since the judge issued his decision, however, the Commission has held repeatedly that the Secretary is not required to prove that controls can achieve Table G-16 levels in order to establish their feasibility. In Continental Can Co., 76 OSAHRC 109/A2, 4 BNA OSHC 1541, 1976-77 CCH OSHD ¶ 21,009 (No. 3973, 1976), appeal withdrawn, No. 76-3229 (9th Cir. Apr. 26, 1977), the Commission held that controls are technologically feasible within the meaning of section 1910.95(b)(1) if they are capable of achieving a significant reduction in noise levels. This holding was reiterated in Samson Paper Bag Co., 80 OSAHRC 60/A2, 8 BNA OSHC 1515, 1980 CCH OSHD ¶ 24,555 (No. 76-222, 1980). The Commission has recently overruled the additional

---

5/ The Secretary filed a petition for discretionary review, which Commissioner Cleary granted pursuant to 29 U.S.C. § 661(i). The petition argued that the judge had erred in holding that administrative or engineering controls must achieve the noise levels given in Table G-16 in order to be considered feasible.

After the expiration of the 30-day period in which a Commission member may direct review pursuant to 29 U.S.C. § 661(i), the Secretary filed a supplemental petition for discretionary review, arguing that the judge had erred in finding that engineering controls could not achieve Table G-16 levels at Cox's worksite and in finding that Cox's employees were adequately protected against excessive noise by personal protective equipment. This supplemental petition was brought to the attention of the three members of the Commission, who all agreed that the parties should be afforded the opportunity to brief the additional issues it raised. The parties were notified of this decision through a document entitled "Direction For Review," which was signed by William S. McLaughlin, who was then the Commission's Executive Secretary. This document inadvertently made it appear that Mr. McLaughlin had granted the Secretary's supplemental petition. Cox contends that the issues raised in the supplemental petition are not properly before the Commission because the petition was not timely filed and because only a Commission member, and not the Commission's Executive Secretary, can direct that a case be reviewed.

Our disposition of this case is predicated on the issue raised in the Secretary's original petition for discretionary review. Accordingly, we need not decide whether the issues raised in the supplemental petition are properly before the Commission.

holding of Continental Can that the economic feasibility of controls must be determined by a cost-benefit analysis. Sun Ship, Inc., OSHRC Docket No. 16118 (Dec. 17, 1982). The decision in Sun Ship, however, reaffirmed the holding of Continental Can that controls need not be capable of reducing noise to Table G-16 levels in order to be feasible. Slip op. at 12 n.11.

The evidence clearly establishes that engineering controls in addition to the quiet rooms Cox installed were technologically feasible. Cox's own investigation into printing press noise controls showed that other newspapers, notably the Dayton Daily News and the Wall Street Journal, had achieved significant noise reductions by means of folder enclosures and acoustical barriers. Moreover, folder enclosures for the type of Goss presses Cox owned were commercially available. William Rouse, the manager of product safety and environment for Goss, testified that such an enclosure had reduced the noise at the Lansing State Journal to 90 dBA. Although Rouse stated that he would not recommend the same type of installation for Cox, he believed that the noise levels in Cox's press room could have been reduced significantly, possibly to 90 dBA, by a more complex system of enclosures and sound barriers. Michael Hine, a highly qualified noise expert who testified for the Secretary, was of the opinion that a 9 dBA reduction could be achieved in Cox's press room by partial enclosures around the presses and that the Lansing-type enclosure, optimized for Cox's operation, could have produced a 20 dBA reduction.[6/]

---

6/ Hine also believed that certain controls in addition to enclosures were feasible. However, if any control that Cox did not implement was feasible, then Cox failed to abate the violation as alleged.

(continued on next page)

Section 1910.95(b)(1) requires that controls be economically, as well as technologically, feasible. Sun Ship, Inc., supra. In order to be economically feasible, the cost of controls must not be so great as to threaten the employer's long-term profitability and competitiveness, unless the employer's inability to afford the cost of controls results from the employer having lagged behind its industry in providing safety and health protection for employees. Id.

The parties presented some evidence concerning the cost to Cox of installing enclosures similar to the Goss enclosure used at the Lansing State Journal. Hine estimated that the total cost would be $300,000, although it is not clear whether this figure included costs associated with his suggestion that the Lansing design be optimized for Cox's operation. Elvidge testified that Cox had been informed by Goss that an enclosure for each folder would cost $40,000 to $50,000, for a total cost of $240,000 to $300,000 for Cox's six presses. However, Rouse, Goss's manager of product safety and environment, estimated that the Lansing-type enclosures, modified to take into account the configuration of Cox's press room, would cost $150,000 per press.

---

6/ (continued)

As we conclude that the record demonstrates the technological feasibility of enclosures, we need not decide whether the additional controls mentioned by Hine are feasible. See Cyprus Mines Corp., OSHRC Docket No. 76-616 (Dec. 17, 1982), slip op. at 8. Although Cox has been proceeding on the assumption that it must reduce the noise levels to less than 90 dBA because its pressmen sometimes work longer than eight hours per day, the evidence concerning the manner in which the pressmen rotate suggests that each individual pressman spends substantially less than eight hours per day outside of a quiet room, even during a day in which the pressman works a double shift. We note that Table G-16 permits higher noise levels than 90 dBA for periods of exposure shorter than eight hours per day.

This case was tried before the Commission issued its decision in Sun Ship, Inc., supra. Accordingly, the parties were not on notice that Cox's ability to afford the cost of controls was relevant to the economic feasibility of the controls, and the parties presented no evidence concerning Cox's financial condition from which we could conclude whether or not the cost of enclosing its presses would threaten Cox's long-term profitability and competitiveness. Although the parties presented some evidence on the cost of enclosures, they did not focus as sharply on this point as they might have had they known such costs would be relevant. Moreover, the parties have not had the opportunity to argue the impact of our decision in Sun Ship on this case. We will therefore remand this case to allow the parties an opportunity to present further evidence and argument on the economic feasibility of enclosures, and for the judge to apply our holding in Sun Ship to this case.[7/]

III

The Commission issued a supplemental briefing order asking whether the Commission has the authority to establish a new abatement date if it should affirm the failure to abate notification. This question arises because, if the Commission were to find that additional feasible engineering controls were available to Cox, unless a new abatement date was established for the installation of such controls, Cox could be subject to additional penalties if it should fail to install the controls immediately.

---

7/ At one point in his testimony, Simonton stated that noise enclosures "would make it very difficult to operate and work on the press efficiently." This suggests that such enclosures might impose additional, indirect costs on Cox. On remand, the parties may present additional evidence bearing on such indirect costs as well as on the direct cost of enclosures. See Cyprus Wire Corp., supra.

Because we are not affirming the failure to abate notification, the issue stated in the supplemental briefing order need not be decided at this time. However, on remand, the judge should afford the parties the opportunity to present evidence concerning a reasonable time period for the installation of enclosures in Cox's press room. If the judge should ultimately affirm the failure to abate notification, he should then consider whether it is appropriate to establish a new abatement date for the installation of the enclosures.

Accordingly, the judge's decision is set aside, and the case is remanded to the Chief Judge[8/] for further proceedings consistent with this opinion. SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: DEC 29 1982

---

8/ Judge Patton has retired.

COTTINE, Commissioner, concurring:

The majority opinion sets forth my rationale for the disposition of this case. However, it fails to respond to a fundamental error in the dissenting opinion affecting the application of the noise standard to this and related cases involving engineering and administrative controls. The dissent expresses the Chairman's personal view that engineering or administrative controls should not be preferred over personal protective equipment,[1/] notwithstanding the explicit requirements of the standard, 29 C.F.R. § 1910.95(b). However, it is not within the Commission's authority as an adjudicatory body to question the wisdom, effectiveness or appropriateness of a standard promulgated by the Secretary. Sun Ship, Inc., OSHRC No. 16118, slip op. at 23-24 n.20 ((Dec. 17, 1982); H.H. Hall Construction Co., 81 OSAHRC 91/D12, 10 BNA OSHC 1042, 1047 1981 CCH OSHD ¶25,712 at p. 32,056 (No. 76-4765, 1981) W.J. Lazynski, Inc., 79 OSAHRC 108/B6, 7 BNA OSHC 2064, 2072, 1980 CCH OSHD ¶24,145 at p. 29,336 (No. 13864, 1979); Austin Bridge Co., 79 OSAHRC 81/A2, 7 BNA OSHC 1761, 1764, 1979 CCH OSHD ¶23,934 at p. 29,021 (No. 76-93, 1979).[2/] Nor is it for the

---

1/ The Chairman relies on note 12 of his dissenting opinion in Sun Ship to conclude that "personal protective equipment is capable of as much as a 20 to 30 dB attenuation in existing noise levels and can reasonably be expected to produce a 10 to 15 dB attenuation." Slip op. at 38. That dissent cited as authority the recent revision of the noise standard to require a hearing conservation program. OSHA Occupational Noise Standard: Hearing Conservation Amendment, 46 Fed.Reg. 4078 (1981)(codified at 29 C.F.R. § 1910.95(c)-(s)). However, the preamble to that modification contradicts the dissent's representation, stating that a more reasonable estimate of the "real world attenuation of hearing protectors" would be 10 dB. 46 Fed.Reg. at 4114.

2/ The dissent overlooks the fact that the hearing conservation program supplements the requirements for feasible engineering and administrative controls. 46 Fed.Reg. at 4078, 4161. The Assistant Secretary expressly deferred any modification of either the permissible exposure level for occupational noise exposure or the priorities among compliance methods. Id. at 4078, 4102, 4105, 4111. The preamble states:

> Engineering controls provide more consistent and dependable protection to worker hearing than personal hearing protectors and are still preferred by OSHA.

Id. at 4114. The dissent attempts to accomplish in adjudication what the Secretary declined to do in rulemaking.

Commission to predict the outcome of presently-pending standard-setting proceedings on personal protective equipment for occupational noise exposure. See Modern Drop Forge Co. v. Secretary of Labor, 683 F.2d 1105, 1111 (7th Cir., 1982); Koppers Co., 77 OSAHRC 44/A2, 2 BNA OSHC 1354, 1974-75 CCH OSHD ¶19,063 (No. 3449, 1974); United States Steel Corp., 77 OSAHRC 12/C3, 2 BNA OSHC 1343, 1974-75 CCH OSHD ¶19,047 (Nos. 2975 & 4349, 1974), (alternate holding), appeal dismissed, 517 F.2d 1400 (3d Cir. 1975).[3/] The modification of the legal preference established by the noise standard would exceed the Commission's exclusive authority as an adjudicatory body, 29 U.S.C. § 651(b)(3), and contravene the statutory delegation of rulemaking functions to the Secretary, 29 U.S.C. § 655(b). Moreover, it would be contrary to the dissenter's expressed view in Sun Ship, Inc. that it is the Secretary's exclusive authority to modify a standard through the statutory rulemaking process. Slip op. at 33 n.7, 39 (Rowland, Chairman, dissenting); see also Id., slip op. at 23-25 n.20 (Cottine, Comm'r, concurring). In fact, it now appears that the dissent would "short circuit" the standard-setting process by declaring the requirement for feasible engineering and administrative controls to be "unenforceable" and thus achieve a preference for personal protective equipment that has not been duly promulgated by the Secretary in conformity with the rulemaking requirements of the statute.

---

3/ Compare 29 C.F.R. § 1910.1000, Table Z-1 (coal tar pitch volatiles standard previously applicable to coke ovens) with 29 C.F.R. § 1910.1029 (coke oven emissions standard).

ROWLAND, Chairman, dissenting:

I dissent from the majority's decision to remand this matter for further proceedings in light of Sun Ship, Inc., OSHRC Docket No. 16118 (Dec. 17, 1982). For the reasons stated in my dissenting opinion in that case, I would find the noise standard unenforceable to the extent that it requires the employer to use "feasible" administrative or engineering controls to reduce noise levels. Accordingly, I would vacate the failure to abate notification at issue here.

In the usual case involving citations to employers for failure to use administrative or engineering noise controls, I have dissented on the above ground without commenting further on the majority's decision. E.g., Cyprus Mines Corp., OSHRC Docket No. 76-616 (Dec. 17, 1982). The circumstances of this case, however, are such that further comment is appropriate.

As the majority notes, Cox, having previously been cited for an alleged violation of the noise standard, attempted to abate the violation by installing quiet rooms for use by its employees. In accordance with its decision in Sun Ship, the majority remands for a determination whether additional measures, specifically enclosure of the presses themselves, would "threaten Cox's long-term profitability and competitiveness." In so doing, the majority fails to give appropriate consideration to the measures Cox has already implemented and to the failure of the additional controls suggested by the Secretary to reduce the noise at Cox's workplace within the levels specified by Table G-16 of 29 C.F.R. § 1910.95(b)(1).

As the majority correctly points out, under the conditions presently existing in Cox's facility, its employees are exposed to excessive noise levels during the time that they are outside of the quiet rooms. As a result of the system of employee rotation in use by Cox, each employee is stationed at the presses for approximately one-third of his total working time, about five hours over two shifts. An employee, therefore, may be exposed to noise levels of as much as 106-107 dBA during that time. [1] However, Cox required its employees to wear personal hearing protection in accordance with Commission precedent holding that such equipment must be used when controls are not sufficient to reduce noise to within the levels permitted by the standard. [2]

Personal hearing protection would also have to be worn even if Cox were to install the enclosures found by the majority to be technologically feasible. As explained above, employees normally spend approximately five hours during the workday at the presses where noise levels are between 106 and 107 dBA. Reducing these levels to between 95 and 97 dBA [3] would not be sufficient to bring the exposure of Cox's

---

1 As the majority points out, the presses do not operate continuously but rather intermittently during a shift. According to Cox's witness Simonton, the periods of operation of presses may coincide with an employee's rotation to the presses.

2 See note 3 of the lead opinion.

3 Although the majority notes the evidence regarding the extent of noise reduction which could be achieved through folder enclosures, it refrains from making a finding as to that reduction. See note 6 of the lead opinion. According to Elvidge, Cox's engineering and production manager, Goss represented that its commercially available enclosures attenuate noise by 10 dBA. This

(Continued)

employees to within the limits prescribed by the standard since the standard permits exposure to such levels for only three to four hours. As a result, even if Cox were to implement the further controls which the majority finds technologically feasible, its employees still would have to wear personal hearing protection for a substantial portion of the time they are working at the presses.

The circumstances here demonstrate the weakness of the majority's interpretation of the term "feasible" on which I commented in my dissenting opinion in Sun Ship. In attempting to comply with the requirements of the noise standard, Cox determined that it would not be possible to reduce noise levels to within those permitted under the standard by engineering changes to the presses themselves. Considering that its employees work on a rotating basis, Cox decided instead to isolate employees from the presses during most of their working shift. By focusing solely on whether Cox could financially

---

(Continued)

representation is consistent with Hine's testimony that these enclosures had achieved a noise level reduction of 11 dBA at the Lansing State Journal. While both Rouse, an engineer for the press manufacturer, Goss, and Hine, the Secretary's expert, gave opinions that greater reductions could be achieved in Cox's facility, neither specified how such reductions could be accomplished. Rouse had never visited the facility, and he did not consider it appropriate to make specific recommendations on behalf of Goss. Similarly, Hine testified that in order to determine how Lansing-type enclosures could be "optimized" for Cox, a "design analysis study" would have to be performed. Accordingly, the most that can be said for the effectiveness of enclosures on this record is that Cox could reasonably expect a reduction of 10-11 dBA through the installation of the enclosures commercially available from Goss. Cf. Snyder Well Servicing, Inc., 82 OSAHRC 10/C5, 10 BNA OSHC 1371, 1380, 1982 CCH OSHD ¶ 25,943 at 32,515 (No. 77-1134, 1982) (Rowland, dissenting in part) (mere opinion, unsupported by any specific evidence, is not a sufficient basis on which to find a violation).

afford to implement yet further controls, without any regard to the nature of the noise problem or the effectiveness of the measures already undertaken by Cox, the majority simply second-guesses Cox's informed judgment as to how best to spend its resources for the protection of its employees. The majority's failure to give due consideration to the combination of quiet rooms and personal hearing protection instituted by Cox is particularly inappropriate in view of the potential effectiveness of hearing protection in reducing noise levels. As I noted in my dissenting opinion in Sun Ship, slip op. at 35 n.12, personal protective equipment is capable of as much as a 20 to 30 dB attenuation in existing noise levels, and can reasonably be expected to produce a 10 to 15 dB attenuation.

As I concluded in Sun Ship, the majority's interpretation of the standard's requirement that controls be "feasible" is erroneous. For the reasons stated above, that interpretation is also inappropriate when applied to the particular facts of this case. Accordingly, I dissent from the majority's decision to remand this case for further proceedings under the majority's test for economic feasibility.

## DECISION

APPEARANCES: Robert H. Buckler, Esquire, Office of the Solicitor, U. S. Department of Labor, Atlanta, Georgia, on behalf of complainant.

C. Lash Harrison, Esquire, Atlanta, Georgia, on behalf of respondent.

James D. Fagan, Esquire, Atlanta, Georgia on behalf of intervenor.

## STATEMENT OF CASE

Patton, Judge: This is a proceeding pursuant to Section 10 of the Occupational Safety and Health Act of 1970 (29 U.S.C. § 651, et seq., 84 Stat. 1590, hereinafter referred to as the Act) alleging a refusal to abate a violation of the Occupational Safety and Health Act.

As a result of an inspection by the complainant, citation against respondent was issued on August 23, 1972, pursuant to section 9(a) of the Act. Said citation alleged a violation of standard 29 CFR 1910.95(b)(1) in that respondent

failed to use feasible administrative or engineering controls to reduce the noise of its presses and folders to sound levels permitted in Table G-16. Abatement date was set as August 2, 1973.

Respondent did not file a contest of citation and proposed penalty and in accordance with section 10(a) of the Act, the citation and penalties as proposed became the final order of the Commission. Petitions for modification of abatement date were filed and said petitions were granted, first extending time of abatement to September 10, 1973, and subsequently extending the time of abatement to November 4, 1974.

Reinspection by an authorized representative of the Secretary was conducted on December 4, 1974, and following said inspection, a Notice of Failure to Abate the Violation was served upon the respondent. A Notive of Additional Penalty in the amount of $400 was also served upon the respondent. The respondent filed a contest of said Notice of Failure to Abate and Notice of Additional Penalty and on June 10 and 11, 1975, a hearing was held before the undersigned Judge in Atlanta, Georgia. Atlanta Web Pressman's Union Number 10 intervened in said hearing and participated through counsel.

## LAW AND ISSUES OF THE CASE

Standard 29 CFR 1910.95(b)(1) is as follows:

"When employees are subjected to sound exceeding those listed in Table G-16,

> feasible administrative or engineering controls shall be utilized. If such controls fail to reduce sound levels within the levels of Table G-16, personal protective equipment shall be provided and used to reduce sound levels within the levels of the table."

It is conceded that the respondent's pressroom did not meet the sound levels required by Table G-16. The issue for determination in this case is whether there are feasible administrative or engineering controls. It is the position of the respondent that feasible controls do not exist; whereas, the complainant maintains that there are several feasible methods whereby the sound levels may be reduced to those permitted by Table G-16. It is the further contention of the complainant that if the evidence should fail to establish that the sound level can be reduced to the level permitted by Table G-16 and it is shown that there is a feasible method to reduce the noise by a lesser amount, the respondent is required to install said engineering controls. It is the position of the respondent that unless engineering controls can reduce the noise to the level permitted by Table G-16, the respondent is not required to install further engineering controls.

## EVIDENCE IN THE CASE

The answer of the respondent admitted that respondent has a place of business and does business at 72 Marietta Street, Northwest, Atlanta, Georgia, where it is engaged in newspaper publishing. The evidence established that Atlanta Newspapers, Inc.

is a part of a multi-state chain of municipal newspapers.

It is stipulated that the Commission has jurisdiction of this case. It is further stipulated that respondent is a corporation engaged in newspaper publishing and at all times relevant to this proceeding has engaged in a business affecting commerce within the meaning of the Act. It is further stipulated that following receipt of the August 23, 1972, citation and prior to the December 4, 1974, inspection, respondent installed "quiet rooms" in its pressroom. The noise level in the quiet rooms is below 90 dBA. It was stipulated that on December 4, 1974, as well as other days since the installation of the quiet rooms, respondent has had employees in its pressroom subjected to sound levels exceeding those listed in Table G-16. The employees of respondent are subjected to sound levels exceeding those of Table G-16 on a regular basis; however, there are no employees who are subjected to sound levels in excess of Table G-16 on every work day. It was further stated that nothing contained in the stipulation prevented respondent from asserting a defense that as a result of its employees wearing hearing protection they are not exposed to sound levels in excess of Table G-16. It is further stipulated that respondent has a program under which personal hearing protection is supplied to employees as a mandatory requirement that hearing protection be worn in its pressroom when the presses are operating.

Each hearing day's transcript is numbered beginning number one. References to the transcript for the hearing held June 10, 1975, will have, following the number of the transcript to which reference is made, the letter (a), whereas references to the transcript of June 11, 1975, will incorporate the letter (b) following the reference to the page number.

The respondent publishes two newspapers, The Atlanta Constitution with a daily circulation of approximately 225,000 newspapers and The Atlanta Journal with a daily circulation of 247,000 to 248,000 newspapers. The joint Sunday edition runs approximately 547,000 papers (Tr. 9, 10(b)). The respondent has six folders (Tr. 56(b)). The respondent has eight presses (Tr. 84(b)). It is possible for the same employees to work both on The Atlanta Constitution and The Atlanta Journal as pressmen. The union controls the time they work. They have worked as much as 13 shifts a week (Tr. 175-176(a)). The folderman working next to the folder rotates with the apprentice if the apprentice has been there long enough to get in the rotation system. The rotation is 30 minutes on the clock (Tr. 178-179(a), 6(b)). The noise level in the pressroom was approximately 106 dBA (Tr. 65(a)). Exposure to the noise is not uniform. A man might spend his 30 minutes while the press is running and on the other hand, the press might not be running during his 30 minutes. Another man might be on the job for the first minutes while the press is running and then he'd be the next man to go back when the

press started back up. For these reasons, according to Mr. Simonton, official with the respondent, it is extremely difficult to figure out the amount of time that an employee is exposed to the noise of the presses. If the press breaks down, he is still subject to the surrounding noise because other presses are still running (Tr. 7-8(b)). The Atlanta Constitution presses average running two and one-half hours a day and The Atlanta Journal average three and one-half hours a day. However, parts of the Sunday paper are run through the presses on several weekdays adding to the time that the presses are running during certain days of the week (Tr. 9(b)). The same employees who work on the daily paper will at times work on the Sunday paper the same day (Tr. 11(b)). A number of employees arrive at 9:00 a.m. or 10:00 a.m. and with an exception of a break in the afternoon, will be there until approximately 5:00 p.m. or 7:00 p.m. If they are having a good run, no presses will run from 5:00 p.m. to 7:00 p.m. If they are having a bad run, they will run during that time. The employees often come back at 7:00 p.m. and work until 3:00 a.m. or 4:00 a.m. getting out the Sunday edition (Tr. 11(b)). They will frequently run a 7:30 p.m. shift, have a short break and then run another shift. At times, the employees are exposed over eight hours (Tr. 15(b)). Pressmen often work 21 out of 24 hours when the work triples (Tr. 12(b)).

A number of possible ways to reduce the noise was suggested by the complainant. A partial enclosure of the press

and the folder was suggested as was a full enclosure of the press and folder. Doctor Michael J. Hine testified for the respondent. Doctor Hine is a professional engineer licensed by the State of Pennsylvania having a Bachelor's Degree in mechanical engineering, and a degree as Doctor of Philosophy (Tr. 12-13(a)). He is a member of the Acoustical Society of America. He received his degree as Doctor of Philosophy from the Institute of Sound and Vibration Research of the University of Southampton, England. He said that it is the only school so far as he knows of that type in the world. His doctoral dissertation was in the area of sound and vibration and his thesis topic was on the acoustically induced vibrations of slender rods in a cylindrical duct. His major area of research interest in school was noise and vibration control. He has had experience in the United Kingdom's patent office examining patent applications in the area of vibration control and transmission design for technical competence. He has worked at Cummins Diesel Engine Company in Columbus, Indiana, on diesel engine crankshaft vibration analysis. He went to the University of Southampton and did postgraduate work in the area of acoustically induced structural vibration specifically for a field problem in nuclear reactors. He did a complete study on noise within limited boundaries, that is, air volumes within contained boundaries. He studied the radiation of sound from vibrating structures

and studied the complete interaction mechanisms of sound waves on solid structures. He worked in the research laboratory of Westinghouse Electric Company doing fundamental noise reduction experimentation on large marine gears on all kinds of electric motors and machinery noise enclosures. He also did vibration analysis control. He worked a year and a half at Harris Corporation in the printing equipment group research establishment in Cleveland, Ohio, where he was engaged to carry out corporate-wide research into noise reduction techniques for web presses. He also carried out experiments during that time on noise reduction for web presses. He went to Southern California Edison Company where he did noise and vibration control of all kinds of equipment located in utility plants. He also performed numerous consultant assignments.

He was of the opinion that full enclosures could be used around the pressroom units or the folders. He stated that a full enclosure is similar in structure to a partial enclosure except that all possible sides of the box-like structure are covered up except small openings for the inlet and exit of paper products, which openings are suitably acoustically treated to prevent the transmission of sound from within the enclosure to the outside of the enclosure (Tr. 50(a)). Such an enclosure was used at The Lansing State Journal, Lansing, Michigan (Tr. 50(a)). According to Dr. Hine, they had Goss Headliner Mark II Presses with a 3-2 folder (Tr. 50(a)). There were full enclosures

around the folder and press units. They had metal panels encasing the folder units with absorptive treatment on the inside of the panels. There were access doors which were spring-loaded in some cases to the open position and latched closed for visual inspection of the inside of the folder enclosure as well as for access. They also had glass or other non-opague material type of windows so that they could see inside the enclosure without opening up the enclosure. Absorbent material used at Lansing formed a type of lined tunnel along which the operators could walk while the press was running and they could "flick the color control switches" (Tr. 51-52(a)). It was stated that an 11 dBA reduction was obtained at the folder. Sixty-seven thousand papers were run per hour. Goss has such an enclosure on the market today (Tr. 52(a)). Dr. Hine was of the opinion that a similar reduction could be achieved by respondent by use of the full enclosure. He stated that in his opinion the reduction could go as high as 20 dBA at respondent's press-room. Reduction of noise would be reduction of noise from motors and gear boxes. Dr. Hine further stated that full enclosures existed at The Norwich Bulletin and that he improved upon it. The full enclosure reduced the dBA from 108 to 93. There were six units at Norwich and one folder (Tr. 67-68(a)). He had only actually seen this done at The Norwich Bulletin, Lansing Journal, Meredith Press and National Geographic (Tr. 69(a)).

In his recommendations he was not considering costs (Tr. 7). Dr. Hine, however, stated that an operator would have to get to the controls to operate the press and it is not possible to use remote switches with the type of press that the respondent had (Tr. 82-83(a)). The National Geographic magazine, however, had remote color control consoles behind the barrier which were effective in reducing the operating noise at the color controls (Tr. 83(a)). Lansing State Journal's full controls are the only ones that he has seen (Tr. 91(a)). He did not know the reading prior to the installation of the full enclosure but knew it was 96 dBA after installation. There were 67,000 papers run per hour (Tr. 92(a)). The witness stated, however, that he built one full enclosure which would be capable of a reduction of 27 dBA (Tr. 92(a)). He stated that at Harris, the whole press and folder had been enclosed rather than individual units and this would be the most effective way of doing it. He predicted noise levels between 85 and 90 dBA operating full speed up to 80,000 papers per hour would be accomplished (Tr. 93(a)). The employee would be outside the barrier and there would be remote controls. He stated Harris had not done all that could have been done to make maximum reduction. Heat could be disposed of (Tr. 96-97(a)). He observed no problem in the operation of the newspaper at Lansing State Journal (Tr. 105-106(a)). They did not have to get in the enclosure to operate the press except for webbing up (Tr. 106(a)). The

enclosure had sliding doors and hinged access doors for getting the press ready for a print run and maintenance access both in the print room and the folder. An employee would merely undo a latch in the door and the door would automatically open of its own accord. Around the press unit they had sliding doors which could be freely swung out of the way to gain access to the press units (Tr. 106(a)). Union exhibit 1 which was introduced into evidence shows the doors of the press and folder and discusses the sound enclosures (Tr. 107(a)). He was of the opinion that what had been done at Lansing could be improved on and that other noise sources should be enclosed, for example, electric motor and gear train in the reel room (Tr. 127(a)).

Mr. Robert Simonton, personnel director for the respondent, stated that after inspecting The Wall Street Journal, he did not recommend it be done by respondent because the sliding doors and everything partitioned would make it very difficult to operate and work on the press efficiently. He was also of the opinion that it would still be necessary to use ear protection with earplugs or muffs (Tr. 25(b)).

Mr. Glen E. Elvidge, director of engineering and production for respondent, has a Bachelor's Degree in mechanical engineering. He is a member of ANPA Production Management Committee and was involved in the installation of respondent's presses. He is also a member of the subcommittee

on environmental control of ANPA (Tr. 52-53(b)). He has seen folder enclosures at Dayton, Houston Post; Miami Herald, Jacksonville, Hollywood and Macon. As far as he is aware, none of them have a noise level around their folders of below 90 (Tr. 54(b)). He was at no installation that has reached a level as low as 89 dBA. He stated that he has knowledge of this subject due to his position with ANPA and that he has participated in committee meetings which gave him an opportunity to have knowledge (Tr. 59(b)). He has knowledge of how to operate noise measurement devices and has taken sound readings for respondent and elsewhere. The readings that he gave, however, were only received for the purpose of showing good faith as it was not established that he had sufficient training to testify as to the dBA from said readings.

Mr. William H. Rouse who is employed by MGD Graphic Systems, Inc., a subsidiary of Rockwell International, testified for the respondent. He stated that he is manager of product safety and environment for said association and has worked for them for 13 years. He has been in his current position two and one-half years. He stated that said association is also known as Goss. He stated that Goss spent over $1,750,000 attempting to engineer noise out of printing presses. They used some outside consultants and had liaison with MIT. He stated that Doctor Lyon and Doctor Manning did some work on quietening of folding machines (Tr. 79-80(b)). A great deal of theory was

established but he stated it was not possible to reduce it in practice. He stated that he was familiar with the Lansing operation. He described it stating that the heart of the installation is a self-standing folder enclosure which is not fastened to the frame of the machine at all. It stands on the floor. In addition, each unit has been fitted on the operating side with a partial barrier in a U section with a very short up-right and a very long horizontal part (Tr. 82(b)). He stated, however, that it is not comparable to respondent's because it was only done for one press, whereas the respondent has eight presses and that he would not recommend it for Atlanta. There are six presses with folders in Atlanta (Tr. 84(b)). He stated that it is generally possible to use remote controls in Atlanta. There would have to be some rebuilding of the ink fountains which he stated would be quite costly. It would cost about $10,000 per unit and there is the equivalent of 68 units making a cost of $680,000 (Tr. 84-85(b)). He stated that remoting of the folder can be done by adjustment. A folder would be about $1,500 per adjustment. He stated that it is impossible to approach reducing the approximately 107 or 108 dBA at respondent's pressroom to 90 from the folder without enclosures. He stated that respondent has problems incident to a metropolitan paper with as many machines as they have and with the machines arranged as they are which wouldn't appear at Lansing and for that reason he wouldn't recommend the Lansing

approach (Tr. 80(b)). He knows of no instance aside from Lansing where a level of 90 dBA or less has been achieved (Tr. 88(b)). He stated that they have never guaranteed any product to accomplish that. Goss has worked with American Newspaper Publishers Association Research Institute in an effort to solve some of these problems (Tr. 88(b)). He stated that no newspaper other than Lansing in the domestic United States has placed an order for a similiar type installation (Tr. 89(b)). Between 70 and 85 percent of the major metropolitan newspapers use Goss (Tr. 90(b)). He stated so far as qualifications are concerned that he was acquainted with all noise work they had done, all environmental work they had done, all the safety work they had done and in addition was rather familiar with the general conformation of the machine and a great deal of the electrical detail (Tr. 91(b)). He stated, however, that he was of the opinion the noise in the Atlanta press room could be reduced significantly (Tr. 92(b)). He stated it possibly could meet the 90 dBA level (Tr. 93(b)). He stated he has ideas of how it could be done but would not want to advance a theory without talking to other members of his team. It would be more than speculation, however. He stated that because the pressroom has parallel rows with the operating side of one press facing the drive side of another, it is essential at that point that a sound barrier be erected between the drive side of one press and the working area at the

operating side of the other press. He was inclined to think it would also be necessary to close up the operating side of the other press to a greater degree than they did at Lansing. He estimated, however, that this would cost approximately $150,000 per press (Tr. 96-97(b)). He stated that it would be necessary not only to box in the press but also the folder and that this contributed to the $150,000 he was talking about. He stated, however, that it was a very rough estimate.

Mr. George R. Cashau testified that he has a Bachelor's Degree in mechanical engineering, and is production engineer for the American Newspaper Publishers Association Research Institute, otherwise known as ANPA RI. He has been with them slightly more than 20 years. He is production engineer which means that he does consulting work, advisory work, development work, and research work for the daily newspapers of the United States who are members of the organization. His function at the time of hearing was environmental work and helping the membership to comply with the Act (Tr. 98-99(b)). He stated he is involved in the noise abatement program. The respondent is a member of the Association. He stated that they purchased sound meter instruments and he checked The Houston Post, Waukeegan Sun, New York Times, Cincinnati Enquirer, Chicago Tribune, Kansas City Star, Miami Herald, and others which use folder enclosures (Tr. 104(b)). He stated that when running 50,000 newspapers per

hour, none was able to reduce to 90 dBA (Tr. 105(b)). He has seen 40 newspapers and has not seen any running at full speed that managed to reduce to less than 90 dBA (Tr. 108(b)). He has seen folder enclosures at some newspapers and some with end treatment (Tr. 109(b)). He stated that said Association has investigated some enclosures in pressrooms and has achieved some reduction, approximately 7 dBA (Tr. 110(b)). He stated that they have a scientific advisory team to advise on problems of noise and environment. He stated that they have renowned scientists, two of whom are former advisors of the President (Tr. 110-11(b)). He stated that no press manufacturer has ever told him of any procedures that reduce to below 90 (Tr. 112(b)). He has seen folder enclosures, barriers, room treatment, quiet rooms and quiet rooms with remote controls (Tr. 114(b)). He stated the only thing that could reduce below 90 is a quiet room with remote controls when the operator is inside, which they have at The Washington Star (Tr. 114(b)).

There were other means suggested for reduction of noise. Dr. Hine also recommended a partial enclosure. He described a partial enclosure as an enclosure which attacks the direct noise field generated by a noisy machine. It consists essentially of a box-like structure placed around the machine with one or more sides of the box removed. It might substantially be a four or five-sided box. He stated that by box he meant a

rectangular box with panel-like sides. He was of the opinion that a reduction of 9 dBA could be accomplished by respondent by such a procedure. He stated using absorbent room treatment, an additional 4 dBA reduction could be accomplished (Tr. 46-47(a)). He described absorbent treatment as materials that absorb sound energy and prevent or minimize a reflection of incident sound energy on them. He stated they come in several forms. They can be a panel-like material which is either hung on the wall or attached to the wall in a flat-like manner. It can be attached to the ceiling. It can also come in the form of a metal panel which has one solid side and an acoustically transparent side. Inside the panel structure there is absorbent material. Such panels can be attached either to the wall or the ceiling. He stated that there is another form of absorbent material which comes in the form of lumps of absorptive material such as a rectangular box-like structure composed of absorbent material. It can be any cross section. They are normally hung from a ceiling in a machinery room to reduce noise. There also is a spray-on type material manufactured by National Cellulose Corporation, which can be sprayed on flat or irregular-type surfaces to reduce reverberant noise. He would not recommend the absorbent remedy alone but in conjunction with barriers (Tr. 34-40(a)). He stated that both partial enclosure and absorbent material were used at The Norwich Bulletin, Norwich,

Connecticut. They accomplished a 15 dBA reduction there (Tr. 48(a)). At Meredith Printing Company in Des Moines, Iowa, a similar method was applied without room treatment (Tr. 48(a)). He stated they also used Armstrong ceiling tile. He was of the opinion, however, that at said company it was primitively done and not airtight (Tr. 48-49(a)). They did not use the best absorptive treatment (Tr. 49(a)). They accomplished a 6 dBA reduction (Tr. 50(a)). He subsequently testified that the use of partial enclosures around press units and folders could result in a 9 to 13 dBA reduction (Tr. 50(a)). It also affects the noise level in the reel room (Tr. 58(a)). He stated he did not know what the dBA level was prior to installation of partial enclosures at Meredith (Tr. 86(a)). He does not know what it was after enclosures. He did observe subjective noise reduction when they opened the folder door (Tr. 86(a)). There was a partial enclosure of the folder with room treatment of absorptive material (Tr. 86(a)). The room enclosure resulted in 15 dBA noise reduction (Tr. 87(a)). He predicted a 9 dBA reduction by partial folder enclosure for respondent (Tr. 87(a)). The Norwich Printing Company used plywood sheets (Tr. 87(a)). He stated that the reduction must be considerable for a person to hear the difference which he succeeded in doing (Tr. 86(a)). There was also a partial enclosure of compensator at The Norwich Bulletin which he stated resulted in 15 dBA reduction (Tr. 86-87(a)).

He stated that his opinion was based on the published design technique for barriers that was published in the Machine Design magazine by two people from Bolt, Beranek & Newman (Tr.87(a)). Such reduction, however, could only be obtained adjacent to the folder and not in the pressroom as a whole (Tr. 87(a)). He stated the sound level at the folder of respondent was 106 (Tr. 87(a)). It could be reduced to 97 (Tr. 87(a)). There was no point in enclosing the folders and doing nothing about enclosing the press units (Tr. 88(a)). He did not test the noise when the presses where running without the folders. He stated that at Norwich when the folder was not operating, the press was 90 or less. It was running at 45,000 impressions per hour (Tr. 89(a)). The noise level would not necessarily increase at 60,000 impressions per hour (Tr. 89(a)). He took readings at 56,000 papers per hour and one run at 65,000 and they had the same dBA (Tr. 90(a)). The number of pages would increase the number of press units and that would increase the noise level within the pressroom (Tr. 90(a)). He referred to an article in Acoustical Treatment of Plant Facilities, Noise-Con 73 Proceedings, which he stated reflected 6 dBA reduction by use of ceiling absorption material alone (Tr. 119-120(a)). He stated that he agrees with this evaluation. He stated that such a procedure would be effective for respondent. It would reduce reverberant noise.

This has not been done by respondent (Tr. 121(a)). Said article was introduced into evidence by the intervenors as an exhibit. He stated the length of the pressroom has nothing to do with the ability to reduce noise (Tr. 125-126(a)). Presses run at a consistent speed during the press run, and the noise being generated is the same throughout the pressroom (Tr. 125(a)). He stated that the number of press units in a room, the larger the noise level is going to be in that room. He stated that all this means to the person who has to reduce the noise is that instead of reducing perhaps ten machines, he has to reduce the noise emitted by all the press units and folders. It just means he has to spend more time and perhaps engineering design in an effort to do that. Physically, there is no problem in treating a large number of contiguous units or a small number (Tr. 126(a)). He was of the opinion that the pressroom in Atlanta Newspapers could be reduced below 90 dBA (Tr. 126(a)).

Mr. Rouse testified that it would be possible to substitute the teakwood pads but pads wear out so fast they would not be considered practical by a metropolitan newspaper (Tr. 81(b)).

Dr. Hine also recommended a combination of absorbent material and what he described as a barrier. He described a barrier as a panel-like structure which is erected in a vertical plane between an observer or a listener and the noisy machine.

Usually such panels are a solid structure. On the face side of the noisy machine they have absorptive treatment. What the barriers usually do is prevent the direct movement of sound waves from the machine to the listener. The reason for using such barriers in conjunction with absorptive treatment is to prevent or minimize the reflected sound coming off the ceiling and coming down to the listener and thus negating most of the effectiveness of the barrier. He was of the opinion that a reduction by this combination of methods could be up to 10 dBA (Tr. 40-41(a)). He stated such barriers are available in the market (Tr. 41(a)). He has seen it used at National Geographic and at Fawcett Printing Company in Rockville, Maryland (Tr. 71(a)). At National Geographic they had two Harris presses arranged side by side with eight units to each press. Between the two press lines and at the end of the folder they had remote press controls consisting of press control consoles where the operators normally stood during a press run. Around these consoles they had erected barriers and triangular absorbers hung from the ceiling. The installation was provided by the Armstrong Cork Company. He took noise readings and found a reduction of 6 dBA (Tr. 41-42(a)). He has not seen the use of absorptive treatment in conjunction with barriers elsewhere, but he has seen barriers used by themselves. He has seen it used in the assembly floor of a corrugated box manufacturer. He stated that generally noise

from a pressroom comes from gear train noise in the press unit. There is some amplification of that noise at certain speeds by resonances within the component parts of the press unit such as the press cylinders and other cylindrical objects. The folder noise, per se, although usually large, is also composed to a great extent from gear noise. The noise generated by the operation of the folder blade and the cutting blade is somewhat impulsive in nature and occurs at a very low frequency, that is, a very low repetition rate. What that noise does is mechanically excite the other parts of the folder and attach structure to radiate noise at the resonant frequencies of the attached structural components. He stated that a box corrugating plant is somewhat analogous and that an 11 dBA reduction was accomplished at said plant (Tr. 45-46(a)). He stated that room barriers could reduce 10 dBA and also would reduce noise in the reel room especially if the reel room was acoustically treated (Tr. 57-58(a)). He was of the opinion that it is feasible to erect barriers. The operator would stand on the opposite side of the barrier to the machine while he was operating it, for instance, push buttom controls on the folder. It would involve remoting the controls on the folder, but he could see no problem in doing that because he has seen it done with corrugating machinery (Tr. 80(a)). He stated one could put ink controls which are electric switches within the barrier itself and therefore seal off the noise coming from the machine

to the operator's side of the barrier. It would also be possible to put a small opening in the barrier there so the operator could put his hands through it and not completely destroy the effectiveness to the acoustic barrier (Tr. 81(a)). He stated that considerable noise reduction would result, even with a slit and with the ear within three feet of the edge of the barrier. A barrier with no opening reduces 9 dBA. The operator would have to get to the controls to operate the press. He had not calculated the reduction if the opening was a foot or two to permit operation of the press. It would not be possible to remote switches for the press (Tr. 81, 82, 83(a)). The National Geographic magazine had remote color control consoles behind the barriers and it was effective in reducing the operating noise at the color controls. He does not know whether they had offset or letter presses (Tr. 83-84(a)).

Dr. Hine also suggested that it would be possible to change the design of the machinery. He stated there are several well-published practical methods of reducing gear and gear train noise. He stated that instead of using straight cut spur gears it would be possible to use helical gears. He stated that because of imperfections in the manufacture, additional noise results, and that geometric imperfections could be reduced (Tr. 53(a)). It is also possible to harden the gears and grind the faces of the teeth. He stated that finer pitch gears can be

used. It is also possible to use wider face width gears. Noise can be reduced in gears by introducing plastic-type gears into the gear train and in sequence. Every gear in the gear train would be made of nylon or some other plastic to reduce noise (Tr. 53-54(a)). He stated that at the time of his appointment at Harris Press he recommended this type of change on the presses there and they were instituted. They reduced the noise level of the machine and the press. He stated the next engineering approach would be to tackle the noise generated by the paper, that is, by the movement of the paper in and out of the press units. It was established that paper noise contributed about 4 dBA to 6 dBA of the noise observed adjacent to the press unit. It is feasible, he stated, to reduce that noise by dampening the motion of the web of paper as it enters and leaves the press unit. Dampening means applying a spring-loaded damp roller to the face of the paper (Tr. 53-54(a)). He stated it is also possible to place nip roll absorbent objects very close to the nip of the rollers to prevent the exit of noise from the nip. It is possible to look at different viscosities of ink to reduce the tearing type noise that results when the paper is pulled away from the printing rolls. It is possible to tackle the cutting noise that goes on in the folder by suitably redesigning the cutter blade and the abutting part of the folder cylinder that the cutting blade strikes. It is possible to resiliently

mount the cutting blade and its abutting member so as to reduce the impact forces of these two parts. It has been shown by experimental redesign of the cutting cylinder that it is possible to reduce cutting noise, per se, by 18 decibels (Tr. 54-55(a)). It is possible to redesign the folding mechanism so as to prevent the high impact forces that result with the action of a folding blade moving into the jaws of its mating cylinder. It is possible to use plastic-faced folding blades. The folding blade essentially tucks the paper into a U-shape cavity. The cavity is lined with plastic. There is a reduction in the impacting forces of the blade as it smashes into the cavity. He stated press unit noise could be reduced by stiffening up the side plate structures of the unit so that they do not radiate noise so efficiently. It is possible to mechanically isolate the gang-walks for the second level of the press units and other attached parts from the press side frames. Press units and folders consist of several mechanical components which have numerous vibrational resonances within the operating speed range of the press. When a component part gets into mechanical vibration resonance, the noise is amplified generated by that part. The way to avoid that is to design that component so that resonant frequencies are out of the range of the forcing frequencies to which it is subjected.

He was also of the opinion that it would be possible

to acoustically seal off the opening between the pressroom and the reel room resulting in quietening of the reel room. A tunnel-like structure could be put over the paper route with absorbent liners. It would also be possible to enclose with full enclosures the drive motors and attached gear box set for the reel stands in the press units. At least 10 and perhaps even a 20 dBA reduction could be accomplished (Tr. 56-57(a)). At Harris he instigated dampening treatments on the V-15A press of the gear panels, also, noise control covers for another web press for a different division as well as a folder enclosure for that other press. He stated that without the use of enclosures, booths and absorption equipment, just changes in the press did not reduce to 90 dBA but that presses running 45,000 impressions per hour had a printing press unit below 90 (Tr. 63(a)). If the folder was operated, it increased the noise to 93 dBA (62-63(a)). The lowest reading in respondent's reel room was 94 dBA (65(a)). He stated that a 2 dBA reduction could be obtained by using plastic-cheeked knife cases -- up to 40,000 copies per hour (Tr. 114). After that speed, the dominant noise is the folding blade slap.

There was considerable evidence introduced as to the cost of accomplishing the various suggested remedies for the noise. The cost of absorption material on the ceiling would be approximately $30,000 (Tr. 70(a)). The cost of panels

would be $20 per square foot. The reel room and pressroom ceilings are approximately 47,000 square feet. At $20 a square foot for installing panels it would come to $940,000.00 (Tr. 74-78(a)). Mr. Hine stated that due to the cost, he would not recommend it (Tr. 78(a)). The attorney for the complainant offered to withdraw that proposal (Tr. 78(a)). The cost of securing remote controls by rebuilding of the ink fountains would be approximately $10,000 per unit for 68 units or $680,000 (Tr. 85(b)). The cost of enclosing the presses would be approximately $150,000 per unit. With eight presses, this would be $1,200,000.

The respondent has made substantial efforts to protect its employees from the effects of noise. In 1967, the respondent offered pressmen earmuffs to wear at their option. In 1969, they were offered either earmuffs or plugs and the wearing of them was made compulsory. The respondent also started a hearing conservation program at the same time (Tr. 146(a)). The conservation program was under the direction of Mr. Robert Simonton, personnel director. The respondent signed a contract with Doctor's Memorial Hospital in Atlanta to test its employees' hearing. Two employees in Mr. Simonton's department were trained to give tests. They were given to all employees in the mechanical department whether they worked in pressroom or not (Tr. 146-147(a)). This program cost $5,000 or $6,000 a year (Tr. 147(a)). They used the Bausch and Lomb Quiet

Ear Protector, Model 5N85. They used Comfit earplugs from Sigma Engineering Company (Tr. 148(a)). Those with ear problems were custom fitted by Adcomold Division of Trend, Incorporated (Tr. 148). The manufacturer's specifications for these three types of personal protective equipment were followed. The respondent also contacted Acousti Engineering Company of Atlanta. They were called in and recommended M. J. Kodaras and Associates of New York. An octave band study was made by Kodaras and recommendations for the pressroom followed (Tr. 149-150(a)).

The respondent decided to and did build what was known as "quiet rooms." They were enclosures with roofs built four feet back from the presses. There were a number of openings (Tr. 165). It reduced the noise to between 82 and 85 dBA (Tr. 165(a)). The said company that did the work for them contracted to enclose the folder if the quiet room did not achieve a reduction below 90 (Tr. 166(a)). Outside the quiet room where the folder was running, the noise was either 106 or 107 dBA (Tr. 166). The cost of the quiet room was $10,000 (Tr. 166-167(a)). The quiet room did not reduce noise next to the folders and if the employees were outside the quiet room they had to wear hearing protection. The quiet room is an area where they could take off earmuffs, smoke and be protected from excessive noise. When they were not in the quiet room they were out working (Tr. 41, 106, 107(a)). In a quiet room an employee could observe

but could not perform work (Tr. 48(b)). In the quiet room, they have buttons to start and stop the press and control the speed of the press. It is remoted in the quiet room at the folder of each press (Tr. 49(b)). Respondent concluded that the only way to protect the employees adequately, other than the wearing of protective equipment, was to isolate the people from the noise and enclose the people rather than the noise, and that is the reason the quiet room was erected (Tr. 59(b)). It was testified by Mr. Cashau that the only thing that would reduce the noise below 90 is a quiet room with remote controls when the operator's inside. This is used at The Washington Star (Tr. 114(b)). At The Washington Star, the sound level at the folder operation is approximately 106 or 107 running about 55,000 units per hour. Three feet above that, in the quiet room, the level is between 82 and 84 dBA (Tr. 114-115(b)).

## EVALUATION OF THE EVIDENCE

It is admitted by the respondent that the level of noise in the pressroom runs as high as 106 or 107 dBA. There is no question, therefore, that Table 16 is not met. A problem arises, however, in determining whether there is a feasible way by which the standard may be complied with. The parties admit that the respondent's employees are wearing either earplugs or earmuffs and there is no contention found in the record that the earmuffs and earplugs fail to protect the employees from a noise

in excess of that listed in Table G-16. It therefore appears that the employees are not actually being exposed to a noise hazard.

The standard, however, provides for the use of earplugs or earmuffs as an adequate protection only in the event that either administrative or engineering controls are not feasible. The respondent cites the case of Secretary v. Continental Can Company, Inc., _____ OSAHRC _____ (Docket No. 3973, 1974), which case is now pending on review, in which Judge Burchmore held that if the employees were protected by either earplugs or earmuffs they were not subjected to a hazard and therefore a standard requiring the adoption of engineering or administrative controls was not a standard authorized by the Act. This case above stated is on review and therefore can not be treated as precedent by this Judge. In the opinion of this Judge, the argument made by Judge Burchmore that if employees are not being subjected to noise because of the wearing of personal protective equipment, a respondent should not be required to spend immense sums of money to bring about another safeguard against excessive noise, is as a matter of practicality, extremely persuasive. It is not, however, within the province of a Judge to determine the wisdom of the acts of the Secretary. The Secretary is the person authorized to promulgate standards. The judiciary may only determine whether a standard conforms to the Constitution and the Act, and if so, whether that standard has been violated. It

is not a judicial function to determine the wisdom of legislation. Engineering controls do constitute a means of protecting employees from a noise which, admittedly, exists in excess volume in the respondent's pressroom. It is within the province of the Secretary to determine the method that must be used to accomplish the result of protection of employees. There is a hazard caused by noise and the Secretary has stated in the standard that engineering methods must be used if feasible to effectuate a protection against the hazard. This Judge cannot second-guess the Secretary by preferring another less expensive method of accomplishing the same result. Therefore, while a good argument may be made as to the wisdom of requiring engineering controls where earplugs will do the job, such argument must be directed either to the Secretary or to the Congress and not to one making a judicial determination.

The testimony does establish that by use of some of the methods suggested by Dr. Hine, a reduction in decibels can be accomplished. A further legal question arises as to whether "feasible" means that it is possible through engineering controls to reduce the noise level below that set forth in Table G-16 or whether any reduction in noise which may be accomplished by engineering controls will establish feasibility. The standard set forth in Table G-16 is a definite standard. A respondent, therefore, has a definite guide to go by in determining whether or not the law

is being violated in the absence of use of feasible controls. If, however, a respondent is required to adopt engineering controls which reduce the volume of noise to some level different from that in the table, there is no "signpost" by which a respondent can determine under what circumstances and conditions respondent is required to adopt engineering methods.

If any degree of reduction in noise necessitates the use of engineering methods, a reduction of one decibel or even a fraction of a decibel would require the expenditure of all necessary money to accomplish such reduction. It is difficult to believe that it was either the intention of Congress or the Secretary that a respondent should be required to spend a million dollars or more in order to make an inconsequential reduction in the volume of noise. If such be the case, the question then arises at just how many decibel reductions meet the test of feasibility. Is it necessary to resort to engineering controls if only a three decibel reduction would be accomplished, if only a five decibel reduction would be accomplished or if only an eight decibel reduction would be accomplished? The answer to this question can only be guessed at by a company faced with a noise problem. The respondent, at its peril, must guess at whether it is required to spend hundreds of thousands or even millions of dollars in order to conform with the law. If this is the result achieved, the standard is a denial of due process of law and is void because of indefiniteness. If a statute or a standard is

subject to more than one construction and one will make the standard legal and the other construction will cause the standard to be void, the construction should be applied which is consistent with legality and validity of the standard. This Judge, therefore, is of the opinion that unless it is established by a preponderance of the evidence that there is a feasible way to reduce the noise to that permitted by the table, no feasible means of engineering control can be held to exist.

It is the position of the complainant that the issue of feasibility is an affirmative defense and that the burden of establishing a lack of feasibility rests upon the respondent and the burden of establishing feasibility does not rest upon the complainant. This position does not appear to be sound.

Standard 29 CFR 1910.95(b)(1) provides that when employees are subjected to sounds exceeding those listed in Table G-16, feasible administrative engineering controls shall be utilized. If feasibility is necessary for there to be a requirement for engineering controls to be adopted, there is no requirement unless such action is feasible. It is necessary that it be established that there is a feasible means before any obligation upon the respondent. It is the duty of the complainant to carry the burden of proof and the issue of feasibility is a part of the complainant's burden.

The issue, therefore, must be determined as to whether

or not the complainant has borne this burden of establishing that there is a feasible means of bringing the noise level down to 90 dBA or less. In the opinion of this Judge, the evidence does establish that there are feasible means whereby the noise can be reduced a number of decibels. For the above stated reasons, however, even if a reduction of eight or ten or more decibels may be accomplished by the use of engineering controls, the respondent is not required to adopt such controls unless it is established by a preponderance of the evidence that said engineering controls will bring the noise level down to that permitted by Table G-16. There is substantial evidence in the record to the effect that such a result is obtainable. A more difficult question arises, however, as to whether the complainant's contention in this regard is established by a preponderance of the evidence. Dr. Hine, who is a very highly trained and experienced expert, suggests several means whereby such a result may be accomplished. He expressed the opinion that a full enclosure of the folders and presses would be the most effective means of reducing the decibels to the required level and he is of the opinion that they could be reduced to less than 90 decibels. Respondent takes the position that an enclosure would be impractical from an engineering standpoint and would hamper their operations. This defense, however, would not appear to have merit as it is established that the Lansing

presses and folders are enclosed and the newspaper appears to be quite capable of properly maintaining the production of its product. The previously stated question, however, as to whether the desired results would be adequately obtained still remains. Enclosures did reduce the noise at Lansing to a level of 90 decibels or less and therefore could be considered a success. The evidence establishes, however, that Lansing is a far smaller operation than is the respondent's and that there is a difference of enclosing one press and enclosing seven or eight presses. There is some conflict of testimony as to whether the results of use of a full enclosure would be substantially affected by a difference in the size of the operation. Dr. Hine was of the opinion that it would not greatly complicate the problem. On the other hand, witnesses introduced by the respondent were of the opinion that the situations were not comparable, but that a greater problem would be caused by the volume of paper and size of operation of the respondent. Dr. Hine was of the opinion that the Lansing method could be improved. It will be observed, however, that The Houston Post, Waukeegan Sun, New York Times, Cinncinati Enquirer, Chicago Tribune, Kansas City Star, Miami Herald and other papers used folder enclosures, but although the enclosures do bring about varying degrees of relief of noise, none of them bring the noise level to the level set forth in Table G-16. Such papers as The Houston Post, New York Times,

Kansas City Star and the Miami Herald would appear to be much more comparable to the respondent in the size of the communities they serve than would be the Lansing newspaper. Serious doubt is therefore raised as to whether the isolated successful experience of Lansing, a much smaller paper, would be duplicated to the same degree by the respondent. Dr. Hine testified that the use of absorbent material and barriers would reduce the noise level 10 or 11 decibels. Even if this be true, this method would still not reduce the decibels to the level set forth in the table. Other methods are suggested such as changing the engineering structure of the presses themselves which would appear to mean a substantial change in the press machines. The initial cost of the presses is $10 million and although the amount of cost is not set forth in the record for the changing of gears and so forth, it could very well run into millions of dollars. The extent to which this would reduce the total noise is not clearly set forth in the record. It is suggested that a dampening treatment would also bring about some improvement. The testimony of Dr. Hine, due to his very excellent expertise, is convincing; however, the testimony of Mr. Cashau raises substantial doubts as to whether the reduction would be of the required level. He testified that the company with which he is affiliated has made an extensive effort to find an answer to the problem of noise. He has observed presses of 40 large newspapers and does not know of any single one

which has managed to, at full speed, reduce the noise to less than 90. He lists nine large newspapers specifically as having enclosures and states that there are also others which he has not specifically named. Mr. Rouse stated that the MDG Graphic System, Incorporated, with which he is associated, also referred to as Goss, has spent over $1,750,000 in attempting to engineer the noise out of printing presses. Seventy to eighty-five percent of the major metropolitan newspapers in the country use his company. He stated the noise might possibly be reduced as low as 90 dBA in Atlanta at a cost of approximately $150,000 per press. The statement that it possibly might be reduced as low as 90 is quite a different thing from saying it can be.

The testimony of Dr. Hine and the statement of Mr. Rouse convince this Judge that it may be possible through the various engineering controls suggested, and most particularly through the use of enclosures coupled with absorbent materials, to reduce the decibels in respondent's pressroom and reel room to below 90 decibels. It is not necessary that this type of success be guaranteed or be certain. The respondent's employees' hearing is not being imperiled due to the use of protective wearing equipment and a quiet room and the evidence shows the cost of improving the situation would range anywhere from $300,000 to $1,500,000. Due to these facts, engineering controls should not be required because such controls <u>might</u> reduce the decibels

to the level required by Table G-16. As above stated, only one newspaper has been cited as meeting the required noise level by use of the suggested methods. This newspaper is substantially smaller than the respondent's. On the other hand, a large number of papers, more comparable to respondent, have been shown to use such methods with some success, but not with such success as to bring them within the level of Table G-16. These facts raise serious doubt as to whether the adoption of the suggested methods in the respondent's pressroom and reel room would meet the requirements of the standard. The only protection to the employees which the record shows is certain to work is the method already being adopted which is the use of earplugs or mufflers and the use of a quiet room to which the employees may go from time to time to get out of the noise. There is no contention that any of the employees' ears are receiving more than 90 decibels of noise. It is entirely possible that one or more of the methods suggested by Dr. Hine would work, but this will not be definitely known until they are tried. The respondent should not be required to spend up to $1,500,000 to answer this open question. This Judge is of the opinion that while such methods might work and reduce the noise to the standard set forth in Table G-16, the evidence does not establish that there is anything approaching substantial assurance of this result. Theory would indicate that enclosures might be successful, whereas the weight of the testimony as to

practice indicates that such changes probably would not be successful in meeting the standard. Other suggested methods would not reduce the noise to the required extent. The respondent can not be found guilty of failure to abate if there is no feasible way in which abatement may be accomplished. The complaint, therefore, can not be sustained.

## FINDINGS OF FACT

1. Respondent is a corporation having a place of business at 72 Marietta Street, Northwest, Atlanta, Georgia, where it is engaged in newspaper publishing. Respondent is a part of a chain of newspapers known as Cox Enterprises, Inc., which chain has newspapers in various states throughout the United States.

2. Respondent is and at all times relevant to this cause has been an employer engaged in a business affecting commerce within the meaning of the Act.

3. On December 4, 1974, as well as subsequent thereto, the respondent's employees have worked in a pressroom in which the sounds exceed those listed in Table G-16 of standard 29 CFR 1910.95(b)(1).

4. Said employees work at various times for a period of time exceeding that permitted by Table G-16 for the sound levels listed in Table G-16.

5. The respondent has since 1969 required its employees subjected to said noise to at all times wear either earplugs or earmuffs.

6. Said employees, while wearing earplugs or earmuffs, are not subjected to noise of as much as that permitted by Table G-16 of standard 29 CFR 1910.95(b)(1).

7. The respondent, prior to December 4, 1974, installed rooms in its pressroom known as "quiet rooms" in which the level of noise was below 90 dBA.

8. The employees could observe the presses and turn them on and off from the quiet room, but to adequately perform their jobs, they had to be outside the quiet room for substantial periods of time.

9. A substantial reduction in noise can be accomplished by the use of full enclosures, absorbent material, partial enclosures, barriers, and changes in the structure of the presses and folders themselves.

10. The evidence establishes that the use of full enclosures with absorbent material may reduce the level to that set forth in Table G-16 of standard 29 CFR 1910.95(b)(1), but the complainant has not proven through a preponderance of the evidence that the use of said procedures either singularly or in combination will reduce the noise to that permitted by

Table G-16 of standard 29 CFR 1910.95(b)(1).

## CONCLUSIONS OF LAW

1. Respondent is engaged in a business affecting interstate commerce and is within the jurisdiction of the Occupational Safety and Health Act.

2. Standard 29 CFR 1910.95(b)(1) is not invalid insofar as it requires the use of feasible engineering controls when personal protective equipment is preventing excessive sounds from reaching the ears of employees.

3. The burden of proving that there is a feasible means of engineering controls rests upon the complainant.

4. The respondent is not required to adopt engineering controls unless such controls will reduce the noise to a level below 90 dBA.

5. The complainant having failed to establish by a preponderance of the evidence that there are feasible engineering controls which will reduce the level of noise below that set forth in Table G-16 of standard 29 CFR 1910.95(b)(1), the respondent is not required to abate the alleged violation of standard 29 CFR 1910.95(b)(1).

## ORDER

It is therefore ORDERED that:

The Notice of Failure to Abate and the complaint alleging failure by the respondent to abate standard

29 CFR 1910.95(b)(1) be and the same hereby are dismissed.

Dated this 4th day of November 1975.

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>CARPENTER RIGGING, INC.,<br>Respondent. | OSHRC Docket No. 76-5125 |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

The decision of the administrative law judge with respect to citation 1 is affirmed. The judge correctly found that the cited standard was preempted by a specifically applicable standard. See 29 C.F.R. § 1910.5(c)(1). Inasmuch as Carpenter Rigging was not alleged to have violated the specifically applicable standard, it is unnecessary to consider the judge's finding that Carpenter Rigging was in substantial compliance with that standard. Accordingly, the judge's decision is affirmed.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: DEC 29 1982

COTTINE, Commissioner, dissenting:

The administrative law judge vacated a citation alleging noncompliance with the construction standard published at 29 C.F.R. § 1926.500(d)(1) on the basis that the Respondent, Carpenter Rigging, Inc.("Carpenter Rigging"), substantially complied with the more specifically applicable steel erection standard published at 29 C.F.R. § 1926.750(b)(1)(iii). The judge's rulings are in error both on the applicability issue and the merits of the citation. My colleagues summarily affirm the first erroneous ruling and avoid the second.

I.

Carpenter Rigging was engaged in the installation of equipment in a corn elevator under construction. At the time of inspection steel erection was 80% completed. The cited area was on the second floor where Carpenter Rigging's employees allegedly were exposed to a 25 foot fall hazard because of the failure to comply with the following guarding requirements of § 1926.500(d)(1):

> (d) Guarding of open-sided floors, platforms, and runways.
> (1) Every open-sided floor or platform 6 feet or more above adjacent floor or ground level shall be guarded by a standard railing, or the equivalent, as specified in paragraph (f)(1)(i) of this section, on all open sides...

Paragraph (f)(1) of § 1926.500 describes a standard railing as consisting of (1) a top rail, approximately 42 inches from the upper surface of the top rail to the floor, (2) an intermediate rail, halfway between the top rail and the floor, and (3) a toeboard.

Carpenter Rigging's employees allegedly were exposed to a 51-inch-wide perimeter opening approximately 25 feet above ground. The opening was located on a stairwell landing, two to three feet from the top riser of the stairway. A steel beam extended across the opening at a height

of 3 or 4 inches above the floor. A second beam extended across the opening at a height of 4 feet 5 inches above floor level. The compliance officer testified that an employee who stumbled at the top of the stairwell could fall through the opening. He further testified that a cord observed lying on the floor between the top of the stairs and the opening created a tripping hazard that could result in an employee falling through the opening. The compliance officer's testimony was not rebutted. In addition, it is undisputed that on the day of inspection at least one Carpenter Rigging employee used the stairwell to gain access to higher levels during the normal course of his duties.

Although employees of another employer were engaged in welding stairway handrails above the second level, no structural steel work was being performed in the area of the cited hazard. Furthermore, there is no dispute that the metal floor on the second level was already firmly bolted and secured, although the walls of the structure were not yet in place. Carpenter Rigging installed equipment in the structure before the walls were erected because of the large size of the equipment. However, the Respondent's project manager testified that equipment would not be brought in through the cited opening on the landing, but through an open wall on either side of the stairs. Therefore, the witness concluded that the passage of equipment would not prevent the installation of a rail at the cited location.

II.

The administrative law judge found that the structure was in the structural steel assembly stage, only temporary steel decking had been installed, and permanent concrete floors had not yet been installed.

He concluded that the steel erection standard at 29 C.F.R. § 1926.750 (b)(1)(iii)[1/] was the more specifically applicable standard. Finding that "the 3-4 inch toeboard and horizontal structural steel member at the 53 inch height...was in substantial compliance with Section 1926.750(b)(1)(iii)," the judge vacated the citation.

On review the Secretary specifically excepts to the finding that the flooring was temporary, arguing that the record establishes that the flooring was permanent, thereby rendering the steel erection standard inapplicable.

Carpenter Rigging maintains that "[a]lthough steel floor had been bolted at the point where the open side existed (R.10), permanent floors had not been installed throughout the building (R. 68)." Respondent's Brief at 6. The Respondent further maintains that "[t]he fact that steel erection had been completed on the floor in question does not automatically trigger the standard at Section 1926.500(d)(1)." Respondent's Brief at 7. Accordingly, Carpenter Rigging concludes that "[w]here permanent floors have been partially completed, but structural steel assembly remains to be completed, Section 1926.750(b)(1)(iii) applies." Respondent's Brief at 8.

---

1/ Section 1926.750(b)(1)(iii) provides:

> (b) Temporary flooring - skeleton steel construction in tiered buildings. (1)
>
> * * *
>
> (iii) Floor periphery - safety railing. A safety railing of 1/2-inch wire rope or equal shall be installed, approximately 42 inches high, around the periphery of all temporary-planked or temporary metal-decked floors of tier buildings and other multifloored structures during structural steel assembly.

III

A.

In concluding that the steel erection standards apply to the facts of this case, the judge found that only temporary steel decking had been installed and the permanent concrete flooring had not yet been poured. However, the record contains no evidence to support the finding that the flooring in the location cited was temporary. To the contrary, unrebutted evidence establishes that the metal flooring in the area cited was firmly bolted and secured, rendering the floor "permanent flooring" under the steel erection standards. See 29 C.F.R. § 1926.750(a)(2). Furthermore, there is no evidence that a concrete floor was to be poured at any time. It is obvious from the Respondent's arguments in this case that it does not consider the flooring at the cited location to be "temporary." Rather, it argues that, because permanent flooring had not been installed throughout the rest of the structure, the steel erection standard applies.

It is unnecessary to the disposition of this case to determine whether the steel erection standards are at all applicable to worksite areas where skeletal steel erection is no longer being performed because there are no steel erection standards applicable to the guarding of open-sided permanent floors. Accordingly, the judge erred and the Commission compounds that error by concluding that section 1926.750(b)(1)(iii), a standard that unambiguously applies exclusively to temporary floors, is specifically applicable to the facts of this case.

B.

Both the cited standard and the steel erection standard applied by the judge require the presence of a safety barrier "approximately 42 inches high" to protect against fall hazards. In Dick Corp., 79 OSAHRC 101/E8, 7 BNA OSHC 1951, 1979 CCH OSHD ¶24,078 (No. 16193, 1979), the

Commission held unanimously that employees working near the open end of a scaffold 23 feet above ground level were not adequately protected by a single horizontal bar located 4 to 6 feet above the scaffold platform.[2/] The Commission stated that the bar "did not even provide protection equivalent to that provided by a top rail, which under the standard must be 'approximately 42 inches high.' " 7 BNA OSHC at 1954, 1979 CCH OSHD ¶24,078 at p. 29,250. The 53-inch-high steel bar in this case is no more equivalent to the protection required by the standard than was the 48 to 60-inch-high steel bar considered in Dick Corp. In addition, there is a total absence of the protection that would be provided by a midrail installed in accordance with the cited standard.

The judge's "substantial compliance" test is also inconsistent with Commission precedent. Well established precedent properly holds that "technical noncompliance" with a standard that results in only a negligible effect on employee safety and health is deemed a de minimis violation not warranting an abatement order or penalty assessment. E.g., Triple "A" South, A Div. of Triple "A" Machine Shop, Inc., 81 OSAHRC 29/B13, 9 BNA OSHC 1543, 1981 CCH OSHD ¶25,295 (Nos. 77-2922 & 77-3169, 1981); Continental Oil Co., 79 OSAHRC 42/C3, 7 BNA OSHC 1432, 1979 CCH OSHD ¶23,626 (No. 13750, 1979); Clifford B. Hannay & Son, Inc. 78 OSAHRC 12/A2, 6 BNA OSHC 1335, 1978 CCH OSHD ¶22,525 (No. 15983, 1978); Rust Engineering Co., 77 OSAHRC 37/C8, 5 BNA OSHC 1183, 1977-78 CCH OSHD ¶21,693 (No. 12200, 1977); National Rolling Mills Co., 76 OSAHRC 121/D7, 4 BNA OSHC 1719, 1976-77 CCH OSHD ¶21,114 (No. 7987, 1976); Van Raalte

---

2/ Dick Corp. involved an alleged violation of the scaffold guarding standard at 29 C.F.R. § 1926.451(d)(10). The scaffold standard contains the same 42-inch height requirement for guardrails contained in sections 1926.500(d)(1) and 1926.750(b)(1)(iii). The only relevant differences among these standards is that sections 1926.451(d)(10) and 1926.500(d)(1) require guardrails made of 2 x 4-inch lumber or equivalent, plus midrails and toeboards, whereas section 1926.750(b)(1)(iii) provides for the use of a single safety railing made of "1/2-inch wire rope or equal."

Co., Inc., 76 OSAHRC 49/B8, 4 BNA OSHC 1151, 1975-76 CCH OSHD ¶20,633 (No. 5007, 1976). However, the uncontradicted evidence in this case establishes that at least one of Carpenter Rigging's employees was exposed to a serious fall hazard of 25 feet, exacerbated by the presence of a tripping hazard in front of an opening that was not adequately guarded to prevent a fall. A de minimis violation could not be found on these facts.

C.

Accordingly, for the reasons set forth above, the judge's decision should be reversed and the citation affirmed.

|---|---|
| SECRETARY OF LABOR,<br>Complainant<br>v.<br>CARPENTER RIGGING, INC.,<br>Respondent | OSHRC DOCKET NO. 76-5125 |

APPEARANCES:

Louis DeBernardo, Esq., for Complainant
Paul M. Sansoucy, Esq., for Respondent

DECISION AND ORDER

This case arose under Section 10(c) of the Occupational Safety and Health Act, 29 U.S.C. §659(c), and came on for hearing on April 11, 1977 at Syracuse, New York.

On November 17, 1976 Respondent was issued one serious citation for which the Secretary of Labor recommended a penalty of $700 and a nonserious citation for which no penalty was proposed. Respondent contested both charges.

Respondent is a corporation organized under the laws of the State of New York, engaging in construction activities; it maintains an office and place of business at Syracuse, New York; many of the materials and supplies used by Respondent were manufactured outside the State of New York; hence, Respondent engages in a business affecting commerce, within the meaning of Sections 3 (3) and 3 (5) of

the Act (Ans. II, III). Based on the foregoing, it is found that jurisdiction over the parties and the subject matter is vested in the Commission.

On November 2, 1976 a compliance officer of the Department of Labor inspected a job site at Montezuma, New York, where a corn processing plant, consisting of several buildings, was under construction (Tr. 5).

29 U.S.C. §654(a)(2) requires that each employer comply with occupational safety and health standards promulgated under the Act.

Pursuant to 29 U.S.C. §666(b), an employer shall be assessed a civil penalty of up to $1,000 for each serious violation.

Section 666(c) provides that an employer may be assessed a civil penalty of up to $1,000 for each nonserious violation.

29 U.S.C. §666(j) declares that "a serious violation shall be deemed to exist in a place of employment if there is a substantial probability that death or serious physical harm could result from a condition which exists, or from one or more practices, means, methods, operations, or processes which have been adopted or are in use, in such place of employment unless the employer did not, and could not with the exercise of reasonable diligence, know of the presence of the violation."

Civil penalties shall be imposed only after considering the size of the business of the employer, the gravity of the violation, the good faith of the employer, and the history of previous violations. 29 U.S.C. §666(i).

The serious citation alleges a violation of the standard at 29 CFR §1926.500(d)(1) in that open-sided floors or platforms, six feet or more above adjacent floor or ground level, were not guarded by a standard railing or the equivalent on all open sides.

The cited standard states:

> Subpart M--Floor and Wall Openings, and Stairways.
>
> §1926.500 Guardrails, handrails, and covers.
>
> ***
>
> (d) Guarding of open-sided floors, platforms, and runways. (1) Every open-sided floor or platform six feet or more above adjacent floor or ground level shall be guarded by a standard railing, or the equivalent, as specified in paragraph (f)(i) of this section, on all open sides, except where there is entrance to a ramp, stairway, or fixed ladder. The railing shall be provided with a standard toeboard wherever, beneath the open sides, persons can pass, or there is moving machinery, or there is equipment with which falling materials could create a hazard.

Complainant contends that on November 2, 1976 (Tr. 11) Respondent failed to properly guard the open side of a landing at the second level of a stairwell in a multi-floored skeleton steel structure being erected (Tr. 8, 9, 13, 27). The structure was to be a corn elevator (Tr. 13).

Respondent's main function at the site was to install equipment, including tanks, hammermills, and bucket elevators; it also intalled some temporary structural platforms (Tr. 47 - 48).

The cited landing, about three feet wide (Tr. 74), had an opening on one side about 25 feet above ground level (Tr. 10).

About 20 feet from the opening stood another building (Tr. 72 - 73). The open side, 51 inches wide (Tr. 74), had a toeboard 3 - 4 inches high (Tr. 28 - 29); across the opening at a height of 53 inches above floor level (Tr. 9) there was a girt, a horizontal structural steel member (attached to beams) to which the siding of the building was to be fastened (Exh. J-1, Tr. 50).

At the time of the inspection, construction had reached to a height of approximately 140 feet (Tr. 68), with perhaps 80% of the steel erection completed (Tr. 48). At the second level the steel floor had been tacked down (Tr. 9 - 10), but the structure was still in a skeleton stage, without walls (Tr. 9).

Only the temporary steel decking had been installed. There had been no installation of permanent concrete flooring. The building under consideration was still in the structural steel assembly stage. In these circumstances, I find that the standard at 29 CFR §1926.500(d)(1) is preempted by 29 CFR §1926.750(b)(1)(iii), which controls multi-floored structures "during structural steel assembly." 29 CFR §1910.5(c)(1) declares that if a particular standard is specifically applicable to a condition, practice, means, method, operation, or process, it shall prevail over any different general standard which might otherwise be applicable.

The applicable standard provides:

> Subpart R—Steel Erection
>
> §1926.750 Flooring requirements.
>
> ***

(b) Temporary flooring—skeleton steel construction in tiered buildings. (1)

***

(iii) Floor periphery—safety railing. A safety railing of 1/2-inch wire rope or equal shall be installed, approximately 42 inches high, around the periphery of all temporary-planked or temporary metal-decked floors of tier buildings and other multifloored structures during structural steel assembly.

In June 1975 the U.S. Department of Labor issued OSHA 2202, a booklet entitled "Construction Industry." The publication describes itself as a digest of construction industry standards compiled to aid employers, supervisors, and safety personnel in their efforts to achieve compliance with OSHA (Occupational Safety and Health Administration) standards. The booklet covers steel erection at pages 27-28. Section 1926.750(b)(1)(iii) is discussed thusly:

56. STEEL ERECTION

***

d. A safety railing of 1/2-inch wire rope or equivalent shall be installed around the perimeter of all temporarily floored buildings, approximately 42 inches high, during steel assembly.

It is worthy of note that this interpretation of the standard encompasses "all temporarily floored buildings," which would certainly include the floor in the instant case.

Section 1926.750(b)(1)(iii) requires a "wire rope or equal." Subpart R offers no definition of the expression "or equal." We are also left with the uncertainty as to how high a protective railing must be to satisfy the required height of "approximately

42 inches high." There was no safety railing of wire rope at the second floor landing, but I find that from the standpoint of safety, the 3 - 4 inch toeboard and horizontal structural steel member at the 53-inch height equalled a 1/2-inch wire rope "approximately" 42 inches high. In light of the foregoing, it is found that Respondent was in substantial compliance with Section 1926.750(b)(1)(iii), which applies to the facts herein.

Since I find that the general standard cited in the serious citation does not apply, and that Respondent was in substantial compliance with the specific steel erection standard which does apply, the serious citation will be ordered vacated.

The nonserious citation involves 29 CFR §1926.25(a). Complainant alleges that empty boxes, scrap lumber, and rags were not cleared from the front approach to the work area on the north side of the corn elevator, exposing employees to accidental tripping over these materials.

The standard reads:

> Subpart C-General Safety and Health Provisions
>
> ***
>
> §1926.25 Housekeeping.
>
> (a) During the course of construction, alteration, or repairs, form and scrap lumber with protruding nails, and all other debris, shall be kept cleared from work areas, passageways, and stairs, in and around buildings or other structures.

Scrap materials were piled in an area outside the corn elevator structure (Tr. 20) on November 2, 1976 (Tr. 21), in

an area about 10 feet by 10 feet (Tr. 40). Respondent's millwright foreman testified that the debris was "approximately eight feet, at least" (Tr. 70) to the side of the entrance to the structure. The inspecting officer described the scrap as being "in front of the building" (Tr. 21). A photograph of record (Exh. C-2) shows, and I so find, that the materials are not directly in the passageway to the entrance, but are off to the side.

Since the debris was not in a work area, or passageway, or on stairs, the Secretary has not shown a violation of the cited standard, and it is so found.

Upon consideration of the record in its entirety, it is concluded that on November 2, 1976 Respondent was not in violation of Section 5(a)(2) of the Act, 29 U.S.C. §654(a)(2), for noncompliance with the standards at 29 CFR §§1926.500(d)(1) or 1926.25(a).

Accordingly, it is ordered that the serious and nonserious citations issued on November 17, 1976 and the proposed penalty notification be and the same hereby are vacated.

| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>FARTHING & WEIDMAN, INC.,<br>Respondent. | OSHRC Docket No. 78-5366 |

DECISION

BEFORE: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

An amended citation issued by the Secretary of Labor alleges that Farthing & Weidman, Inc. ("F&W") violated four crane safety standards. Administrative Law Judge Vernon Riehl vacated the citation on the ground that any violations were caused by employee misconduct for which F&W is not liable. The case is before us under 29 U.S.C. § 661(i). We affirm the judge's disposition in part and reverse in part.

Items 1(b) and (c); 29 C.F.R. §§ 1910.180(h)(3)(vi) and (h)(4)(ii).

Items 1(b) and (c) of the amended citation allege violations of 29 C.F.R. §§ 1910.180(h)(3)(vi) and (h)(4)(ii). These standards stated that "[t]he operator should avoid carrying loads over people" and "[n]o person should be permitted to stand or pass under a load on the hook." These standards, like their source standards, sections 5-3.2.3.f and 5-3.2.4.b of ANSI B30.5--1968," Crawler, Locomotive and Truck Cranes," use the word "should." Section V of the introduction to the ANSI source standard states that "should" signifies an advisory standard. Such standards are not mandatory and may not be applied here. 1/

1/ See General Electric Co., 80 OSAHRC 127/F10, 9 BNA OSHC 1185, CCH OSHD ¶ 25,079 (No. 76-2982, 1980); Brown & Root, 80 OSAHRC 112/D2, 9 BNA OSHC 1027, 1029, 1980 CCH OSHD ¶ 24,958, p. 30,795 (No. 76-2938, 1980) (involving

We also do not inquire whether F&W violated 29 U.S.C. § 654(a)(1), section 5(a)(1) of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678, which the Secretary pleaded in the alternative. The adoption by the Secretary of a standard covering a condition--here, the presence of an employee under a load--precludes citation under section 5(a)(1) of the Act, whether the standard is mandatory or advisory. 2/ Items 1(b) and (c) are therefore vacated. 3/

Item 1(a); section 1910.180(h)(3)(i)(b)

Item 1(a) alleges noncompliance with section 1910.180(h)(3)(i)(b), which requires that a load be "well secured and properly balanced in the sling or lifting device before it is lifted more than a few inches." F&W employees had attached sling hooks to an opening in the top of a very large aluminum tank. The sides of the opening that the sling hook contacted were not strong enough to support the tank's weight. One end of the tank was lifted. An employee crawled underneath. The sling hooks then ripped through the metal and the tank fell on the employee, killing him.

F&W operated a truck crane, which is governed by section 1910.180. See section 1910.180(b)(1) (application of section). Also the parties do not dispute

---

(Footnote 1 cont'd)

section 5-3.2.3.f of the same ANSI standard, adopted indirectly under section 1926.550(a)(17)), pet. for rev. dismissed, No. 81-4003 (5th Cir. Jan. 20, 1981); A. Prokosch & Sons Sheet Metal 80 OSAHRC 96/A2, 8 BNA OSHC 2077, 2080-81, 1980 CCH OSHD ¶ 24,840, pp. 30,628-9 (No. 76-406, 1980) (same, adopted under section 1926.550(b)(2)), pet. for rev. dismissed, No. 80-4241 (2d Cir. March 27, 1981); McHugh & McHugh, 77 OSAHRC 35/A2, 5 BNA OSHC 1165, 1977-78 CCH OSHD ¶ 21,629 (No. 13010, 1977) (involving section 1910.180(h)(4)(ii)).

2/ See Prokosch, 8 BNA OSHC at 2080-81, 1980 CCH OSHD at pp. 30,629-30.

3/ Commissioner Cottine dissents from this disposition for the reasons stated in his dissenting opinion in Prokosch. As in Prokosch and John T. Brady & Co., 82 OSAHRC 9/D10, 10 BNA OSHC 1385, 1982 CCH OSHD ¶ 25,941 (No. 76-2894, 1982), rev'd, No. 82-4082 (2d Cir. Oct. 14, 1982), he believes that the merits of the Secretary's allegations under section 5(a)(1) should be determined by the Commission.

that a load was not well secured in a sling. In any event, a load is obviously not well secured within the meaning of the standard when it is suspended by sling hooks attached to a portion of the load too weak to support the load's weight.

F&W's argument at the hearing 4/ was that the load was not "lifted" within the meaning of the standard because only one end of the load was raised into the air. We are unconvinced. To say that the tank involved here was "lifted" hardly strains the meaning of the word, and, indeed, accords well with its plain meaning. In any event, we must construe this standard in light of its purpose: 5/ to prevent loads from falling to the ground. To hold that partially suspended loads may be poorly secured, and hence may fall to the ground, would be inconsistent with that purpose. 6/

Given the presence of employees in close proximity to the lifting operation, we also have no difficulty in concluding that the record sufficiently shows access to the violative condition. We emphasize that our case law, which requires that the Secretary show access, does not require that the Secretary precisely track the movements of employees to show that they will be or have been in a zone of danger. We have rejected such a brinkmanship approach to employee safety and health. See Otis Elevator Co., 78 OSAHRC 88/E5, 6 BNA OSHC 2048, 2050, 1978 CCH OSHD ¶ 23,135, p. 27,952 (No. 16057, 1978); Gilles & Cotting, Inc., 76 OSAHRC 30/D9, 3 BNA OSHC 2002, 1975-76 CCH OSHD ¶ 20,448 (No. 504, 1976)(concurring opinion). In any event, the driver of the truck that was to be backed up to the raised end of the tank would have been in the zone of danger had the work

---

4/ F&W did not file a brief before either the judge or the Commission.

5/ See, e.g., Anaconda Aluminum Co., 81 OSAHRC 27A/A2, 9 BNA OSHC 1460, 1477, 1981 CCH OSHD ¶ 25,300, p. 31,349 (No. 13102, 1981).

6/ F&W's argument is founded on the premise that the "load" is the tank. This may not be so. Section 1910.180(a)(26) defines "load (working)" as the "external load, in pounds, applied to the crane...," i.e., as the weight of

proceeded as planned. Also the deceased employee was under the tank. Access has been clearly established. 7/

We also find that F&W is responsible for the conduct and knowledge of its supervisory employee at the site. Mr. Kirklin, F&W's foreman and crane operator at the site, personally inspected and approved the sling arrangement before he lifted up the tank. Inasmuch as Mr. Kirklin was a supervisor, and a corporation such as F&W can have knowledge and take action only through persons such as Mr. Kirklin, Mr. Kirklin's knowledge and conduct ordinarily would be imputed to F&W. 8/ We have held, however, that an employer may not be held liable for the knowledge and conduct of a supervisor if his actions were contrary to effectively communicated and enforced work rules. 9/

On the day before the violation occurred here, the president of F&W showed Mr. Kirklin and the other F&W employees at the site how the tank was to be lifted out of the ground. He told them to secure a chain sling around a railroad tie, drop it into the hole in the tank, and then lift the railroad tie. This would distribute the load so that stress was not placed on only a single spot on the top of the tank. The tank was later lifted out of the ground in this way.

---

(Footnote 6 cont'd)

the matter being raised. See Havens Steel Co., 78 OSAHRC 53/C11, 6 BNA OSHC 1740, 1743 n. 8, 1978 CCH OSHD ¶ 22,875, p. 27,673 n.8 (No. 15538, 1978); Alfred A. Austin Constr. Co., 76 OSAHRC 50/A2, 4 BNA OSHC 1166, 1976-77 CCH OSHD ¶ 20,660 (No. 4809, 1976). It may therefore be that the weight of one end of a tank is itself a load and therefore may not be lifted more than a few inches without being well secured in a sling.

7/ If the deceased employee's presence in the zone of danger had been contrary to an enforced workrule of the employer, his presence could not be the predicate for a finding of access. See Frank Swidzinski Co., 81 OSAHRC 4/E14, 9 BNA OSHC 1230, 1232, 1981 CCH OSHD ¶ 25,129, p. 31,032 (No. 76-4627, 1981). F&W does not argue, however, and nothing in this record shows that F&W employees had ever been told to not go under a suspended load.

8/ See Daniel Construction Co., 82 OSAHRC 23/A2, 10 BNA OSHC 1549, 1551-2, 1982 CCH OSHD ¶ 26,027, p. 32,672 (No. 16265, 1982); H.E. Wiese, Inc., 82 OSAHRC 18/A2, 10 BNA OSHC 1499, 1505, 1982 CCH OSHD 25,985, p. 32,613-4 (No. 78-204, 1982).

9/ Id.

The Secretary claims that this evidence does not warrant a finding that F&W is not responsible for Mr. Kirklin's conduct the next day, when the alleged violation occurred. He maintains that F&W's work rule--that the tank be lifted with a chain sling wrapped around a railroad tie--was not shown to be directed or to be understood as being directed at the lifting operation the employees were to perform the next day. He argues that just as F&W itself attempted to draw a distinction at the hearing between lifting the tank entirely out of the ground and lifting up only one end to place it onto the truck trailer, the employees also might not have understood that the tank was to be tilted in the same way it was entirely lifted.

We have many times emphasized that it is not enough for an employer to merely communicate safety rules. If safety rules are to serve as useful vehicles for implementing an employer's final responsibility for compliance with occupational safety and health standards, employees must understand that the rules will be enforced. 10/ This principle is at least as important for supervisors as it is for other employees. When a supervisor violates a safety rule, he not only endangers himself and others; he also suggests to his subordinates that safety rules are not to be taken seriously. It is for this reason that an employer who seeks to avoid liability for the conduct and knowledge of its supervisory employees must show that the rule was accompanied by enforcement. 11/

We therefore find it critical here that F&W neither claimed nor attempted to show that it ever enforced its safety rules. We note in this connection that F&W's president was present at the hearing and Mr. Kirklin was presumably avail-

---

10/ E.g., Marson Corp., 82 OSAHRC 29/C4, 10 BNA OSHC 1660, 1662, 1982 CCH OSHD ¶ 26,075, p. 32,804 (No. 78-3491, 1982). On the necessity for enforcement, see Niagara Mohawk Power Corp., 79 OSAHRC 36/A2, 7 BNA OSHC 1447, 1979 CCH OSHD ¶ 23,670 (No. 76-2414, 1979). See also B-G Maintenance Management, 76 OSAHRC 60/A2, 4 BNA OSHC 1282, 1976-77 CCH OSHD ¶ 20,744 (No. 4713, 1976).

11/ Judge Riehl erred in failing to consider whether F&W's safety rules were enforced.

able to testify on F&W's behalf. Absent evidence that F&W's safety rules were enforced, we impute Mr. Kirklin's knowledge and conduct to F&W, and affirm item 1(a).

Item 1(d); section 1910.180(h)(4)(i).

Item 1(d) alleges noncompliance with section 1910.180(h)(4)(i), which states that "[t]he operator shall not be permitted to leave his position at the controls while the load is suspended." The standard was violated when Mr. Kirklin, F&W's crane operator and supervisor at the site, left the controls while one end of the tank was suspended. The compliance officer testified that F&W's president had said that crane operators always had been told not to leave crane controls while a load was suspended and that he (the compliance officer) believed that was correct. He also testified that he had no reason to believe the crane operator's action was more than an isolated occurrence. As with item 1(a), however, F&W neither claimed nor showed that its workrule was enforced. We therefore impute Mr. Kirklin's knowledge and conduct to F&W, and affirm item 1(d).

Penalty

The Secretary alleged that the violations as serious within the meaning of section 17(k) of the Act, 29 U.S.C. § 666(j). We agree. Incidents that occur as a result of a violation of either sections 1910.180(h)(3)(i)(b) or (h)(4)(i) present a substantial probability of death or serious physical harm. See Wright & Lopez, Inc., 81 OSAHRC 92/D10, 10 BNA OSHC 1108, 1114, 1981 CCH OSHD ¶ 25,728, p. 32,079 (No. 76-256, 1981).

Section 17(j) of the Act, 29 U.S.C. § 666(i), requires that the Commission consider the size of the employer's business, the gravity of the violation, the employer's good faith and history of previous violations. The manner in which the Secretary calculated his proposed penalty indicates that F&W is a small employer, had no history of previous violations and acted in good faith. The gravity of the violations could be severe, as the fatality here demonstrates.

However, there was limited exposure to the hazard. Under these circumstances, we find that the Secretary's proposed penalty of $240 is appropriate.

Accordingly, the judge's decision is affirmed in part and reversed in part. Items 1(b) and 1(c) are vacated; items 1(a) and 1(d) are affirmed. A penalty of $240 is assessed.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: DEC 29 1982

ROWLAND, Chairman, dissenting in part:

Although I join in vacating items 1(b) and 1(c), I would also vacate items 1(a) and 1(d). The majority concludes that F&W failed to rebut the Secretary's showing that it knew or with the exercise of reasonable diligence could have known of the violations. I disagree. It is unnecessary in my view for an employer to come forward with evidence that he not only informed a supervisory employee of a workrule but that he warned the supervisor that discipline would be imposed if the rule were not followed.

Under Commission precedent, a violation of the Act cannot be found unless the record establishes that the employer knew or with the exercise of reasonable diligence could have known of the presence of the violation. Prestressed Systems, Inc., 81 OSAHRC 43/D5, 9 BNA OSHC 1864, 1981 CCH OSHD ¶ 25,358 (No. 16147, 1981); General Electric Co., 81 OSAHRC 42/A2, 9 BNA OSHC 1722, 1981 CCH OSHD ¶ 25,345 (No. 13732, 1981), and cases cited. These cases reflect both the long-established principle that the Act does not impose strict liability on employers and the congressional intent that employers be held responsible only for hazards they can reasonably be expected to prevent. See generally Marson Corp., 82 OSAHRC 29/C4, 10 BNA OSHC 1660, 1664, 1982 CCH OSHD ¶ 26,075, pp. 32,805 (No. 78-3491, 1982)(dissenting opinion). Because an employer normally acts through agents, however, the actions and knowledge of supervisory employees are ordinarily imputed to their employer. Id. I have previously acknowledged that the employer may rebut a showing of imputed knowledge by going forward with evidence that workrules were communicated to supervisory employees and enforced but I reserved decision on whether the employer need enforce the workrules. See H.E. Wiese, Inc., 82 OSAHRC 18/A2, 10 BNA OSHC 1499, 1508-9 n.8, 1982 CCH OSHD ¶ 25,985, p. 32,617 n.8 (No. 78-204, 1982)(dissenting opinion).

There can be little doubt that F&W communicated workrules implementing the cited standards. The president of F&W had only the day before shown Mr. Kirklin,

the crane operator and foreman at the site, the correct way to lift the tank. Kirklin also knew of F&W's rule that crane operators were not to leave the crane controls while a load is suspended. This is not enough for the majority, however.

The majority seems to fault F&W for two reasons: first, that F&W did not prove that it had actually disciplined employees for past infractions of its rules; and second, that F&W did not prove that its supervisor understood that F&W's rules would be enforced. Neither of these reasons are persuasive.

To hold an employer in violation of the Act for failing to show that a rule has been enforced in the past is utterly illogical where, as here, there is no suggestion in the record that F&W had ever had occasion to discipline its employees. 12/ And if the majority is to be consistent, it cannot fault F&W for not showing that Mr. Kirklin had been disciplined after the violation allegedly occurred, for the majority has held that the imposition of discipline after the fact is insufficient. 13/

It therefore seems that the majority decision reduces to little more than this: To rebut the Secretary's showing of knowledge, an employer must show that his supervisors were made to understand that work rules would be enforced. Presumably, such understanding would come through admonishment to the supervisor that infractions of the rules will result in discipline. This goes too far.

---

12/ See Asplundh Tree Expert Co., 78 OSAHRC 77/E12, 6 BNA OSHC 1951, 1954, 1978 CCH OSHD ¶ 23,033, p. 22,841 (No. 16162, 1978); cf. Jones & Laughlin Steel Corp., 82 OSAHRC _____, 10 BNA OSHC 1778, 1783, 1982 CCH OSHD ¶ 26,128, p. 32,888 (No. 76-2636, 1982)(employer unaware of violations of rules; need for monitoring therefore not perceived).

13/ Western Masschusetts Electric Co., 81 OSAHRC 63/B13, 9 BNA OSHC 1940, 1945, 1981 CCH OSHD ¶ 25,470, p. 31,766 (No. 76-1174, 1981); Niagara Mohawk Power Corp., 79 OSAHRC 36/A2, 7 BNA OSHC 1447, 1449-1450, 1979 CCH OSHD ¶ 23,670, p. 28,702 (No. 76-2414, 1979).

A supervisor has risen to a responsible position because he has demonstrated his understanding that his employer's workrules are to be obeyed and enforced. Indeed, one of his primary functions is to ensure that his subordinates comply with his employer's rules. To require employers to show that supervisors have also been specifically warned not to violate those rules is excessive and insulting. When an employer tells his supervisors of a workrule, he does not offend their intelligence and sense of loyalty with an overbearing reminder of the consequences of disobedience. I therefore do not join the majority in imposing this unnecessary burden of production. The Commission should at least presume that a supervisor understands that workrules will be enforced. Accordingly, an employer should be held to have successfully rebutted the Secretary's showing of knowledge when the record shows that the employer communicated to supervisors workrules implementing the cited standards. 14/ I therefore dissent.

---

14/ I express no opinion on whether and to what extent the Secretary could himself come forward with evidence of the employer's failure to enforce workrules against supervisors. I also express no opinion on whether an employer is required to do more than communicate workrules to non-supervisory employees. See Marson Corp., 10 BNA OSHC at 1666 nn.14 & 16, 1982 CCH OSHD at p. 32,807-8 nn.14 & 16.

| SECRETARY OF LABOR,<br><br>Complainant<br><br>v.<br><br>FARTHING & WEIDMAN, INC.,<br><br>Respondent | DECISION AND ORDER<br>OSHRC DOCKET No. 78-5366 |

APPEARANCES: ROBERT S. MILGRIM, Esquire, U. S. Department of Labor, Office of the Solicitor, Kansas City, Missouri
For the Complainant

J. R. MARTIN, Esquire, Blanchard, Van Fleet, Martin, Robertson and Dermott, P. O. Box 729, Joplin, Missouri
For the Respondent

STATEMENT OF CASE

Vernon Riehl, Judge, OSHRC

This is a proceeding pursuant to section 10 of the Occupational Safety and Health Act of 1970 (29 USC 651 et seq.) contesting a citation issued by the complainant against the respondent under the authority vested in the complainant by section 9(a) of that Act. The citation alleged that an inspection of a workplace under the ownership, operation and control of respondent revealed the existence of workplace conditions that violated section 5(a)(2) of the Act for the reason that these conditions failed to comply with certain occupational safety and health standards promulgated

by the Secretary of Labor pursuant to section 6 thereof.

A description of the alleged violations contained in said citation states:

> Item Number 1
> Section 5(a)(1) of the Occupational Safety and Health Act of 1970: Employment and a place of employment which were free from recognized hazards causing or likely to cause death or serious physical harm to employees were not provided, in that:
>
> On or about October 19, 1978, an employee was allowed to work under a suspended load (aluminum tank) which was improperly secured to a chain sling. The tank was not properly blocked or secured to prevent it from falling, at a job site located at Gulf Oil Chemical Company Plant located 2 Miles North of Riverton, Kansas 66770.

## DISCUSSION

Respondent employed approximately nine employees in its various business activities, including, and at all times pertinent, at its workplace at Riverton, Kansas, where it was engaged in a business affecting commerce.

As a result of an inspection by a authorized representative of the Secretary, respondent was issued a citation for a serious violation with a notification of proposed penalty. Respondent duly filed a notice of contest to the citation.

On October 19, 1978, respondent's employee, Kerry Davenport was killed when a tank which was connected to a crane fell on him (T. 4, 15). The tank was hooked to the truck mounted crane through the use of a chain sling hooked to the tank (T. 20, 21; exhibits 2, 3).

Lifting a tank which is attached to a crane by means of a hook is a recognized hazard within industry. This hazard was likely to cause death or serious physical harm, in this case did, to one of respondent's employees (T. 23).

Respondent is charged with not assuring that the load suspended from its truck mounted crane was secured and properly balanced in the sling before it was lifted more than a few inches (T. 22).

Respondent was also charged with not assuring that the operator of its truck mounted crane avoided carrying a load over one of its employees (T. 21). Also, that one of respondent's employees was permitted to pass under a load on the hook of its truck mounted crane (T. 21). Respondent is charged with permitting the operator of a truck mounted crane to leave his position while a load was suspended (T. 21, 22). Respondent's employee, Kerry Davenport, died as a result of his exposure to the hazard of a tank falling on him.

A careful examination of the credible evidence of record establishes that this was an isolated occurrence and that respondent was not in violation of either 5(a)(1) or of any of the standards for which he was cited.

The Secretary of Labor called just one witness, Harold Johnston compliance officer for the Occupational Safety and Health Administration. The record consists of Johnston's testimony, plus certain statements made by both counsel.

Also as a part of the record were a number of photo exhibits of the tank involved in the accident.

The following bits of testimony in the record would indicate that respondent had properly instructed its employees the day before the accident and that the occurrence was an isolated incident:

> Q. (by Mr. Milgrim)
> You testified just a few moments ago that you had a conversation with Mr. Weidman, sitting over here, at the time you went to the Gulf facility, is that correct?
>
> A. That is correct.
>
> Q. What did you discuss with Mr. Weidman?
>
> A. I discussed what he thought caused the accident. Mr. Weidman was very cooperative. He explained, to his fullest knowledge, what he knew, as he was not there at the time of the accident. He did state that he had been there the day previous. (T. 14)

Mr. Weidman, the president of respondent company, stated that the day prior to the accident they had lifted a similar tank and he had instructed his employees to use a portion of a railroad tie and secure the chain sling around the railroad tie and drop it into the hole, so it would distribute the load, and they would not be pulling on the aluminum tank (T. 19).

This would of course show that respondent's president had informed the employees the day before of the proper method of completing the operation.

Mr. Weidman stated that the same crew hooked up the tank the day before, as which lifted it out of the ground, on the day of the

accident. The same crew involved in the accident, October 19, had used a railroad tie which they slipped inside the tank and hooked the chain sling onto, to do the lifting. The compliance officer said he had no reason to doubt that this was the situation, and it was the proper method of lifing the tank.

The compliance officer said this method as used on the first day, and directed by Mr. Weidman, would have been acceptable and not a violation of the Act; that there would not be a citation for the actions used on the first day as directed by Mr. Weidman. In other words, respondent's employees knew how to properly lift a tank on the first day when they were lifting it and being instructed by Mr. Weidman (T. 26). The compliance officer, on examination, also stated that he learned from Mr. Weidman that the crane operators always have been instructed never to leave the controls on a crane that had any load suspended on it. He, the compliance officer, believed that was correct.

The following testimony took part at this point:

> JUDGE RIEHL: Before you go any further, have you any reason to believe, from any other witnesses or any other source, that this more than just an isolated occurrence?
>
> THE WITNESS: No, I have not.
>
> JUDGE RIEHL: As far as you know, it was just an isolated occurrence.
>
> You may proceed. (T. 27)

On the day of the accident Mr. Weidman was not present, three

of his employees were, Mr. Kirklin, Mr. Davenport and Mr. Osburn.

Mr. Kirklin was the operator of the crane and the supervisor. Mr. Osburn was the operator of the truck and Mr. Davenport was a helper, laborer (T. 28). On the day of the accident, October 19, there was no intention to lift the tank into the air. The compliance officer was informed that respondent's employees were tilting the tank by using the crane to lift it.

The compliance officer also testified the following:

> JUDGE RIEHL: Let me go into this just a little further. You have no information from anybody who saw it or talked to him before he went in, as to why he went in?
>
> WITNESS: No, I do not.
>
> JUDGE RIEHL: All you have is conclusions from the various parties involved?
>
> WITNESS: That is right.
>
> JUDGE RIEHL: Let me ask this, Mr. Milgrim. Do you have any further evidence of witnesses to bear on this?
>
> MR. MILGRIM: No, I do not, Your Honor. When Mr. Martin is finished with cross-examination, I would like to move to redirect. (T. 31, 32)
>
> MR. MILGRIM: Your honor, it is the Secretary's position that we do not have to prove that this particular employee had a job function underneath the tank on the particular occasion. It is the Secretary's position that, just like an unguarded punch press or any other piece of equipment like that where in the functioning of the punch press, you do not have to put your hands in the machine but hands do go into machines and employees do, somehow fall under tanks.
>
> JUDGE RIEHL: Yes, but what are you establishing

> a pattern of ever having been done before? As I understand it, this is sort of an ad hoc deal, isn't it, just a one time deal?
>
> MR. MARTIN: This is right, Your Honor. That is exactly right. That is the reason we are hearing this thing. It was ridiculous to have been filed in the first place. (emphasis added) T. 35, 36)

The complainant has cited the case of Floyd S. Pike Electrical Contractors, Inc., v. Occupational Safety and Health Review Commission, 576 F.2d 72 (5th. Cir. 1978). The court held:

> * * * But an employer is responsible if it knew or, with the exercise of reasonable diligence, should have knows of the existence of a serious violation. A particular instance 'of hazardous employee conduct may be considered preventable even if no employer could have detected the conduct, or its hazardous nature, at the moment of its occurrence, . . . [where] such conduct might have been precluded through feasible precautions concerning the hiring, training and sanctioning of employees.

In the instant case we are dealing with an ad hoc situation, a one-time shot. This is not a regular part of the conduct of the work at respondent's workplace. Therefore it must be viewed in a slightly different light. We fail to see how the employer could have done more than he did, when on the preceding day he showed the workers how to properly use a railroad tie and lift a tank in a manner which the compliance officer said was entirely proper.

We feel it is an isolated incident, when the employees whom you have told how to do a thing properly the day before, for some strange reason, decide to do the opposite and cause an accident. This is an isolated occurrence which could not have been prevented

under the circumstances prevailing.

There is no evidence to rebut the preponderance of uncontradicted evidence of record which establishes a showing of respondent moving the tanks properly the day before the violation, proper instruction by Mr. Weidman, owner of the company, and, the complete disregard of his instructions the next day. The citation therefore must be vacated.

It is very evident that the foreman, for some reason, acted contrary to respondent's previous safety instructions the day before and respondent could not reasonably have been expected to have foreseen the foreman's error. Floyd S. Pike Electrical Contractor Incorporated v. Occupational Safety and Health Review Commission, 576 F.2d 72.

To hold the respondent in compliance with an absolute duty of guranteed compliance at all times in this singular situation would be to impose a duty which is not achievable, a result not intended by Congress.

The probative evidence of record establishes that the respondent did take all the necessary precautions under the circumstances to prevent the occurrence of the violation.

Accordingly, respondent can not be chargeable with failure as set forth in the complaint.

## FINDINGS OF FACT

1. Mr. Weidman, the president of respondent's company, on the day prior to the accident and the consequent citation, had

supervised the lifting of a similar tank on his premises and had instructed its employees to use a portion of a railroad tie and secure the chain sling around the railroad tie and drop it in the hole so it would distribute the load.

2. The day the accident occurred, respondent's employees were in the process of removing a portion of the tank, the deceased employee climbed up a ladder, installed a chain sling by hooking one hook in the upper portion of the tank and the other hook in the lower portion of the tank, he then got down, and respondent's employee Kirklin went up and reviewed the way it was hooked to the open portions of the tank. The hooks on the chain sling were hooked directly into the top of the aluminum tank.

3. Exhibits 2 and 3 show the method of hooking up the tank. The tank was then lifted and tipped approximately 3 feet. Employee Osburn went back to check the situation and all of a sudden the tank fell killing respondent's employee, Davenport (T. 26, 27).

4. Respondent's employee Kirklin had left the controls when the tank fell, his statement was, "I got off to see what was happening and the tank fell." The hooks on a chain sling are not designed to lift particular parcels. They are designed to hook into a lifing mechanism or to be wrapped around a load and hooked back to the chain itself. The design of a hook on a chain is such that if you lift a load with a hook, you put all the weight on the smallest portion of the hook. This should be knowledgeable to anyone who does this type of operation. The material can rip out

(T. 22, 23).

5. Such conduct, on the part of respondent's employees on the day of the accident, constitutes a recognized hazard within respondent's industry (T. 23).

6. Complainant had been permitted to amend his complaint to charge as well as a 5(a)(1) violation, to 29 CFR 1910.180(h)(3)(vi), thus making their pleading in the alternative. The day preceding the accident respondent's president, Mr. Weidman, raised another tank by using the proper methods as he directed the tank moving operation. The compliance officer had no information from anybody who saw the accident or talked to the deceased employee before he went into the area of peril, or why he went in (T. 32).

7. The complainant presented only one witness, the compliance officer. The compliance officer said this is the only case of such violation by respondent that he knows of, and he had no indication that anyone had done it on a previous occasion.

## CONCLUSIONS OF LAW

1. Respondent is, and was at all times, an employer within the meaning of section 5(a) as defined in section 3(3) and 3(5) of the Act.

2. Jurisdiction is conferred upon the Commission by section 10(c) of the Act, and the citations issued were in accordance with section 9(a) of the Act.

3. Respondent is not in violation of section 5(a)(1), or of 5(a)(2) of the Act in the standards as set forth in the amendment

to the complaint.

4. The incident for which respondent was cited was an ad hoc (one-time work effort) action on the part of respondent. It was not a part of its usual work schedule in its regular business but a one-time action to remove tanks.

5. The failure to comply with the standard resulted from the unpreventable misconduct of the foreman and respondent's employees.

6. Respondent's president, Mr. Weidman, directed the work efforts on the preceding day before the accident and removed a tank with the appropriate methods as set forth and approved by the Act and the standards thereunder.

7. The respondent took all reasonable precautions to properly instruct his employees on the day preceding the accident and conducted a work effort in accordance with the Act and the standards thereunder.

8. The respondent had done all that reasonably could have been expected of it to insure compliance with the provisions of the Act.

9. The violations committed by the employees were a result of an unexpected disregard of instructions given them on the preceding day before the accident by Mr. Weidman, the president of respondent's company. This constituted an isolated incident.

## DECISION

Based upon the above findings of fact and conclusions of law, it is hereby ORDERED: The citation for violation of 5(a)(1) and of

5(a)(2) and the standards as set forth in the complaint are vacated.

Appearances:

T. TIMOTHY RYAN, JR., Esq., Solicitor of Labor,
JAMES E. WHITE, Esq., Regional Solicitor,
JORDANA WILSON, Esq., Office of the Solicitor,
Dallas, Texas, for Raymond J. Donovan, Secretary of Labor, U.S. Department of Labor, Complainant.

ANDREW J. RODRIGUES, Esq., for Bethlehem Steel Corporation, Respondent.

BOBRICK, Judge

This proceeding was commenced pursuant to Section 10(c) of the Occupational Safety and Health Act of 1970, 29 U.S.C. 651, et seq., (hereinafter referred to as the Act), wherein Respondent, Bethlehem Steel Corporation, contested several Citations issued by Complainant, Raymond J. Donovan, Secretary of Labor, U.S. Department of Labor. Trial was held in this matter before the Honorable Jerry W. Mitchell.

During the course of the hearing the parties agreed to amicably resolve all of the contested citations, except for Serious Citation No. 1, Item 1; the parties on June 22, 1981, filed a settlement agreement under which an Order could be issued disposing of these Citations. On February 11, 1982, this matter was reassigned to me upon the departure from the Occupational Safety and Health Review Commission of Judge Mitchell on March 1, 1982. An Order was issued advising the parties of the reassignment and allowing any party who believed there existed credibility determinations crucial to resolving any factual dispute, as to the remaining contested Citation, to request either a partial hearing or a de novo hearing if that was deemed necessary. Neither party to these proceedings requested such a hearing. Proposed Findings of Fact and Conclusions of Law were filed by the parties. This matter is now ready for decision.

Citation No. 1, Item 1, charged Respondent with a serious violation of the general duty clause of the Act, 29 U.S.C. 654(a)(1), Section 5(a)(1).[1/] The Citation alleged that Respondent had violated Section 5(a)(1) in that:

> "The employer did not protect his employees from the recognized hazard of falling from an elevation posed by lifting of personnel with a defective crane. The employer could have protected his employees by means such as enforcing their policy of crane operators turning in, "Crane Operators Daily Checklists" on a daily basis. Also, to make sure that defective equipment on these checklists such as inoperable dogs be repaired before allowing lifts of personnel by crane. Employees were exposed to the hazard of falling from an elevation in areas such as the dry dock area of the Rigging Department."

---

1/ Section 5(a)(1) reads in pertinent part:

> (a) Each employer -- (1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees.

## FACTS OF THE CASE

Respondent, Bethlehem Steel Corporation, operates a shipbuilding and repair facility in Beaumont, Texas. At its worksite, Respondent operates several gantry cranes which are used in its shipbuilding and ship repair work. The cranes are operated by skilled personnel who are given comprehensive on the job training as crane operators (Tr. 371, 417). A gantry crane is a crane situated on top of a tower that is mobile; the tower runs on rails. The crane itself has one motor which powers its winches. One winch operates what is referred to as "the boom hoist line", a wire line which raises or lowers the boom in elevation. A second winch, operates the "light load line", which is used to raise or lower the load suspended from the boom. Power from the single motor in the crane is transferred to the winches through a clutch mechanism. Only one winch can be powered at any one time.

The winch motor comes equipped with an automatic braking mechanism and each winch has a foot pedal operated friction brake mechanism. The automatic brake is one which is automatically engaged when there is a disruption in the power to the motor. Thus when power is applied to the motor powering the winch, the brake disengages and remains so until that time power is again disrupted. The foot brake is engaged when the operator steps on a foot pedal in his cab; a mechanical brake is then applied to the winch (Tr. 455-457, 468, 469).

There exists on the winches devices known as "dogs". This is a mechanical device that engages the teeth of the ratchet wheel on the winch. The dog, once engaged, will prevent the winch from rotating in a direction that allows the wire line to unwind from the winch so as to lower the load suspended from the crane. The function of the dog was likened by several

witnesses to an emergency brake of a car and is engaged when the winch is placed in a stop position; to engage the dog, the operator would push on a threaded shaft that extended out of the dashboard or panel of the crane cab. Generally speaking, the witnesses agreed that the dog would be used when a load was to be suspended from the boom for other than a short period of time, or when personnel were to be suspended by the crane. It was further agreed that the crane could be operated safely without use of the dog (Tr. 421, 449, 472, 492, 493).

There existed at the worksite a work practice whereby the operator of the crane, upon initially manning the crane, would review a checklist prior to placing the crane in operation (Tr. 436). The checklist, entitled CRANE OPERATOR'S DAILY CHECKLIST, dealt with the material condition of twenty-four separate mechanical components of the crane. As the operator progressed through the checklist he would mark each particular item as being either "OK" or "FAULTY". The first ten of these items were printed in red and the checklist bore the following instruction:

> "Check the following items at the start of each shift for each crane operated. If any RED item is faulty DO NOT OPERATE CRANE but notify your supervisor immediately. ALL FAULTS MUST BE CHECKED BY SUPERVISOR AND reported to maintenance as soon as possible but never later than end of shift."

Among those first ten items marked in red was the item "CONTROL LEVERS AND DOGS" (Complainant's Exhibit #25).

When the operator had completed going through the checklist, marking it as appropriate, he would then turn in the checklist to his immediate supervisor, who in turn would forward it to the maintenance department for assignment of a mechanic to make the repairs (Tr. 436, 440, 447). In those instances where one of the items listed in red was marked as defective, or where there was a significant problem with the crane, the operator would

signal for the supervisor to come to the crane whereupon he would inform the supervisor of the problem or of the defective item marked on his checklist (Tr. 498). The supervisor in turn would then make an assessment whether the crane could be operated safely, notwithstanding the problem or existence of the red item noted as defective (Tr. 348, 362, 438, 471, 488, 489). If the supervisor determined that the crane would not be safe to operate with the defective equipment he would advise the operator not to operate the crane until repairs had been made (Tr. 349, 444, 490, 512). In most all events the supervisor would immediately inform the maintenance department of the problem or defect, as noted on the checklist or as related by the operator, and repairs would be quickly made (Tr. 343, 348, 449, 451, 481, 561). Each operator had the option of not operating the crane when he believed the crane was unsafe because of any particular defect in its mechanisms (Tr. 349, 452, 477, 486).

On April 11, 1980, crane operator, Mr. Jack Richard, reported to Gantry Crane No. 15. Prior to placing Crane No. 15 into operation he reviewed and marked the checklist noting that, among other defects, the dog was not engaging the ratchet of the light load line winch. He marked as defective the item shown as "CONTROL LEVERS AND DOGS". Later in his shift he found that the swing brake on the crane needed adjustment (Plaintiff Exhibit #31, Tr. 411). He notified his immediate supervisor, Mr. Red Chreene, about the swing brake (Tr. 342, 411, 609, 615). While Mr. Richard indicated on the checklist that the dog was defective, he apparently never informed Mr. Chreene of that fact (Tr. 343, 344, 351, 359, 524, 609, 610, 615). Supervisor Chreene, in turn notified the maintenance department of the swing brake on Crane No. 15 and a mechanic was dispatched to make repairs to the swing brake and to correct any other problems which the operator might bring to the mechanic's attention (Tr. 342).

The mechanic who reported to the crane was informed by Mr. Richard that the swing brake was defective, which he in turn repaired. Mr. Richard did not inform the mechanic that there was a problem with the light line dog (Tr. 609, 610, 613). Once the swing brake was fixed, Mr. Richard resumed full operation of the crane.

During the morning the crane was used to suspend a scaffold holding painters who were painting the side of a ship. At approximately 9:00 a.m., crane operator Richard was directed to lower the boom of his crane so as to lower and re-position the scaffold (Tr. 373, 375). According to Mr. Richard, he then began to operate the controls so as to lower the boom (Tr. 375-380). During the course of his lowering of the boom, he heard the cable reeling off the light load line spool and realized that the scaffold holding the men was falling (Tr. 377). By the time Mr. Richard realized what was happening, it was too late to apply the friction brake and the scaffold hit the ground injuring those men who were painting from the scaffold (Tr. 377).

The Respondent conducted an investigation of the incident almost immediately after it took place. Two supervisors and a crane operator went to Crane No. 15 to test the various mechanical components of the crane to determine the cause of the scaffold falling and to determine whether the incident could be attributable to a malfunction of any of the crane's equipment or mechanisms (Ex. C-29, Tr. 192, 515). The crane was given a thorough checkout in all modes revealing that none of its mechanical components were defective (Tr. 345, 346, 497). The inspection team did notice that a nut had been placed upon the threads of the light load dog shaft that extended from the dashboard, and that this nut prevented the light load dog from engaging the teeth of the ratchet on the winch. Once the nut was removed the light load dog worked properly (Tr. 353, 354, 361, 369, 522, 536). This was the first instance that Respondent knew such a condition

existed wherein a nut was placed on the shaft handle of the light load dog (Tr. 354, 367, 479, 504, 522, 534, 554, 562, 610, 615). The simple removal of the nut remedied that situation preventing the light load dog from being engaged (Tr. 536, 614, 615).

There existed no reasonable explanation or reason why the nut was placed on the shaft of the dog preventing the dog's normal operation (Tr. 354, 612). Respondent had no actual knowledge of the existence of the condition. Nor could Respondent reasonably anticipate or foresee both the existence of the condition and the failure of a trained and qualified crane operator, who considered the dog to be a safety device, to inform his supervisor of the condition (Tr. 481, 485). Additionally, there was no degree of reasonable foreseeability to a trained and qualified operator failing to inform a repairman, who had reported to the crane to affect other repairs, of the dog's defective condition thereby preventing the quick and immediate repair of the inoperative dog (Tr. 554, 562, 609-611, 614-615).

## ALLEGED VIOLATION OF SECTION 5(a)(1) OF THE ACT

Section 5(a)(1) of the Act requires of an employer that he "furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees". Commission rulings concerning the Secretary's burden in establishing the existence of a 5(a)(1) violation hold that there must be a showing that the employer failed to render its workplace "free" of a hazard, that the hazard was "recognized" and that the hazard was causing or likely to case death or serious physical harm to its employees. K-Mart, 1982 CCH OSHD para. _____; Jones & Laughlin Steel Corp., 1982 CCH OSHD para. 26,128, 10 BNA OSHC 1778; Brown and Root, Inc., 1980 CCH

OSHD para. 24,853. With respect to recognition of the hazard, Commission rulings place upon the Secretary the burden to show that the manner in which an employer went about the activity criticized in the Citation was known by it to be hazardous or was generally recognized as such by its industry. United States Steel Corp., 1982 CCH OSHD para. 26,123, 10 OSHC 1752; Pratt & Whitney, 1980 CCH OSHD para. 24,447; SSC Corp, 1976-77 CCH OSHD para. 20,814.

The Commission has further pointed out that it is upon the Secretary to show that there were feasible steps the employer could have taken to avoid the Citation -- in other words it is the Secretary who must establish the feasibility of its abatement charge within its Citation. Brown and Root, Inc., supra. The courts have adopted the Commission's views as to what proof the Secretary must establish in order to sustain its charge that an employer violated Section 5(a)(1) of the Act. Baroid Division of NL Industries, Inc. v. OSHRC, 660 F. 2d 439 (10th Cir. 1981); Whirlpool Corp. v. OSHRC, 645 F. 2d 1096 (D.C. Cir. 1981); Pratt and Whitney Aircraft v. Secretary of Labor, 649 F. 2d 96 (2nd Cir. 1981); Usery v. Marquette Cement Manufacturing Co., 568 F. 2d 902 (2nd Cir. 1977); National Realty and Construction Co. v. OSHRC, 489 F. 2d 1257 (D.C. Cir. 1973).

Viewing the instant record, I find that the credible evidence in this case has established that the Secretary has not met his burden of proof in establishing that a violation of Section 5(a)(1) of the Act existed at Respondent's workplace, as that burden of proof has been articulated by both the Review Commission and reviewing courts.

The Complainant maintains that Respondent violated the general duty clause of the Act by its failure to protect employees from the recognized hazard of falling from an elevation caused by lifting personnel with a

defective crane. Complainant, as part of its Section 5(a)(1) charge, submits that the employer could have protected its employees from such hazard by enforcing its policy of crane operators turning in the "CRANE OPERATORS DAILY CHECKLIST" on a daily basis and then taking appropriate corrective action on same. Further, the Complainant urges that the Respondent knowingly operated Crane No. 15 with inoperable dogs, equipment Complainant considered to be essential safety devices required to be in operation at all times.

The Respondent, on the other hand, argues that the handling or processing of its operator checklists was not the primary means of addressing and correcting defective or faulty mechanisms or components which might render a crane, or a part thereof, unsafe, and that it had in place well established and recognized procedures for handling and correcting defects. Respondent's procedure had the operator, after completing its checklist and noting any defectives in equipment, immediately notify his supervisor of any defects in those first ten items listed in red or of other mechanical problems considered serious (Tr. 348, 436, 437, 438, 442, 443, 450, 471, 488, 489, 522, 539); the supervisor would then make a determination whether the crane could still be operated safely or not, and whether the crane's activities in whole or part should be curtailed (Tr. 438, 490, 542). The supervisor would instruct the operator as to the limits of his use of the crane and would arrange for the defective equipment to be corrected immediately (Tr. 348, 349, 480, 481, 483). According to Respondent the crane operator, in any event, could decline to use the crane if he believed it to be unsafe (Tr. 349, 452, 454).

Respondent argues that this method of reporting and correcting defects was the most effective and immediate method by which unsafe conditions on

the crane could be quickly remedied. Further, Respondent argues that it did not know of the defective dog or knowingly operate the crane with a defective dog, and that it could not have anticipated that an experienced trained operator would fail to inform both his supervisor and a repairman, who was readily available to repair the malfunction in the dog, of the condition of the dog. Lastly, Respondent argues that notwithstanding the fact that it considered the defective dog not to render the crane unsafe, had it been informed of the condition of the dog, that condition would have been corrected immediately, and that the cause of the defective dog not being repaired was solely chargable to the misconduct of the crane operator.

I find that the overwhelming evidence in this case substantiates Respondent's position. The Complainant totally misconstrues the objective evidence in this case and further ignores the essential fact that the accident would never have taken place had the crane operator not violated Respondent's established procedure of informing the supervisors or maintenance department of the red listed defective equipment, in this case the faulty light line dog.

The Complainant in determining that a violation of the general duty clause existed, places undue emphasis on the administrative handling of the crane operator checklist. Complainant holds to the theory that once a check was placed on the checklist for any red item the crane was not to be operated until the fault was corrected, and that the checklists were to be administratively handled and circulated in an expeditious manner to accomplish same. Complainant has pointed out that at times the checklists were seen by the maintenance department at the end of the day or at times not at all.

I do not find the handling of the checklist, in whatever fashion shown in this case, to be the type of safety procedure comtemplated by Complainant, since the purpose of the checklist was to aid the operator in reviewing the material condition of the crane rather than as a voucher to obtain repair services for critical components. It is hard to distinguish Respondent's CRANE OPERATOR DAILY CHECKLIST from an airplane pilot's checklist used to check out the essential workings of the plane prior to engaging in flight. The Respondent had in place a well run and well established program wherein the operator informed his supervisor of any significant defects; the supervisor in turn arranged for immediate repair and evaluated the condition to determine if the crane could be safely operated. The credible facts in this case proved that this system worked effectively and efficiently to insure safe operation of the cranes (Tr. 343, 347, 348, 362, 436, 440, 444, 447, 448, 449, 451, 452, 458, 471, 481, 485, 488, 489, 490, 498, 512, 539, 542).

I believe the objective evidence has demonstrated that Complainant's insistence that the method by which the checklist was circulated or handled was a breach of some safety procedure is ill-founded. As Respondent cogently throughout the trial pointed out, the checklist did not require the discontinuation of use of the crane when any of the first ten red items were marked as faulty. The checklist specifically provided that "all faults must be checked by supervisor and reported to maintenance as soon as possible". The evidence clearly established that this was done, except for the instance involved in this case. Additionally, this method of addressing defects in the mechanical components of a crane is in accord with standards for the operation of cranes issued by the American National Standards Institute (ANSI) Section 4-2.2.2(a), notwithstanding Complainant's argument

to the contrary.[2/] The Complainant's argument essentially chooses form over substance. The Complainant's argument that the completion, routing and processing of a checklist is a preferred safety procedure over a method whereby mechanical problems are resolved through personal conversations between the crane operator, supervisor and maintenance department is just not persuasive as a matter of fact. Complainant's charge that a violation of Section 5(a)(1) occurred by reason of Respondent's failure in "enforcing their policy of crane operators turning in "crane operations daily checklist" on a daily basis" is not found actionable in these proceedings. In this regard, I do not find the existence of a hazard (whether recognized or not) as alleged by Complainant to support its Citation. Jones & Laughlin Steel Corp., supra; Brown and Root, Inc., supra; United States Steel Corp., supra.

---

2/

Complainant, in attempting to establish the existence of a recognized hazard, forwards the proposition that by reason of the wide acceptance of the standards published by the American National Standards Institute (ANSI), concerning the operation and inspections of cranes, "the clear inference from these standards is that operating cranes with defective controls and safety equipment exposes individuals near the cranes to hazards". Complainant, in reaching this conclusion, relies on ANSI standard B30.4-1973, entitled Portal, Tower, and Piller Cranes, which at Section 4-3.1.3(k) provides "All controls shall be tested by the operator at the start of the new shift. If any controls do not operate properly, they be adjusted or repaired before operations are begun", and Section 4-2.1.2(d), which provides that all safety devices shall be frequently inspected and a determination made as to whether any deficiencies constitute a hazard. Also cited by Complainant is Section 4-2.1.3(e) which requires periodic inspection of pawls and ratchets for excessive wear (Exhibit 34). I do not agree with Complainant's view in this matter since Respondent was in complete compliance with ANSI Standard 4-2.3.3(e) entitled Adjustments and Repairs, which provided that "A defect disclosed by the inspection requirements of Section 4-2.1 shall be corrected before operation of the crane is resumed, except where a qualified engineer certifies that the crane may be operated". As can be seen, Section 4-2.3.3(a) sets forth what action is to be taken when complying with 4-3.1.3(k) and 4-2.1.2(d); it follows then that the option given by the ANSI standards to allow the crane to be used notwithstanding the existence of a defect, does not support that inference given by Complainant.

Notwithstanding the merits of Complainant's argument concerning the "checklist" procedure, consideration must be given to the operation of the crane with the defective dog, especially when the crane was used to hoist workmen, and whether that amounted to a violation of the general duty clause. Complainant argues that the light load line dog was a safety device whose operation was essential to safety. Respondent disagrees.

A dog is a mechanical device that engages the teeth of the ratchet on the drum of the winch to prevent the winch from rotating in a manner as to allow the wire rope to pay out from the drum of the winch. The dog cannot be engaged if the winch is rotating (Tr. 359). It can only be engaged when the winch is in a stopped position. While the light load line dog has been characterized as a safety device for use on the winch, it generally was agreed that it was not used during momentary pauses in suspending loads (Tr. 382,449). Apparently the dog is used when a load is suspended from the crane while the crane is moving, or when a load is to be suspended for a long period of time (Tr. 449). In instances where the load is suspended in one position for only five or ten minutes, the crane operators find it unnecessary to engage the light load dog (Tr. 449). It was good procedure to use the dog when personnel were being suspended from the crane, as was practicable (Tr. 492,293). Clearly though, the option to use the dog is a decision left to the crane operator as a preference, rather than as a regular procedure (Tr. 477). The correct functioning of the dog did not always relate to the safe operation of the crane (Tr. 421, 449, 472, 492, 493).

The accident that gave rise to the inspection of Respondent's worksite, and which formed the basis for issuance of the Citation involved herein, dealt with the suspension of a scaffold carrying workmen at Crane No. 15, the position of such scaffold being continually changed both in location

and in height throughout the morning of April 11, 1980 (Tr. 381). Whether the use of the light load dog at that time was a safety necessity is a debatable point and apparently will remain so when viewing, in its best light, that evidence submitted by the Complainant on this point. It is clear though that the condition of the dog on Crane No. 15 was not a factor in the accident occurring April 11, 1980, since it could not have prevented the fall of the scaffold. The dog was not designed nor did it have the capacity to stop a rotating drum (Tr. 301, 362).

It is noteworthy, however, to mention that the witness who was most positive on the need for the use of the dog for the safe operation of the crane was Mr. Richard, the operator of Crane No. 15 at the time of the accident (Tr. 382, 399, 422). The most persuasive evidence established that it was he who failed to inform both his supervisors and a repairman, who was dispatched to the crane to perform any repairs necessary, of the defective dog (Tr. 343, 344, 349, 351, 379, 524, 609, 610, 613), notwithstanding his claim of doing so (Tr. 406, 409, 413, 428, 431). The actions of Mr. Richard in effect allowed the crane to be operated with a faulty dog while suspending personnel on the scaffold. The repairman who had reported to the crane to effect repairs to the swing brake could have easily repaired the dog, once informed, before the crane was placed in use to suspend personnel from the scaffold since correction of the problem amounted to no more than the simple removal of the nut from the dog's shaft handle. (Tr. 504, 522, 556, 562, 612, 613, 614, 615). It can only be concluded that this witness, upon whom Complainant relies in large measure to establish his case, did not after all appear to be concerned about the condition of the dog as a safety device, or as an essential component in the safe operation of the crane, since he had at hand the means of effecting complete and

immediate repair to the faulty dog yet failed to take advantage of it. It follows that his testimony in general cannot be considered at all helpful in resolving the factual issues in this case.

I do find the testimony of employee Gabriel Comeaux, a crane operator for 35 years, more credible than any other witness on the subject of crane operations and work conditions at Respondent's workplace.[3/] Mr. Comeaux testified that the use of the light load dog was unnecessary when suspending loads for five to ten minutes (Tr. 449). He further indicated that some operators when going from use of the light load friction brake to the boom friction brake would engage the dog and that this was an extra safety precaution to keep the load from falling if something should happen to the brake, but it was the operator who would make this determination in the safe operation of the crane (Tr. 454, 459, 471). Whether the use of the dog was necessary or appropriate for use on April 11, 1980, in view of the fact that the position of the scaffold carrying the personnel was frequently being changed, is an issue that cannot be resolved on this record.

After considering the persuasiveness of all the testimony given on use of the dog, only one certain conclusion can be reached and that is that the Complainant has failed to present sufficient credible evidence to preponderate on the issue of whether or not the operation of the crane with a defective light load dog was a recognized safety hazard to which employees were exposed. I find that the Complainant has failed to meet his burden of proof in establishing the existence of a recognized hazard and as such the Citation must be vacated.

---

3/ The testimony of crane operator Gaspard concerning the use of the dog (Tr. 492) when considered in context with the fact that repairmen were readily available to fix any defects listed as the 10 red marked items of the checklist was not enough to bring the required certainty to Complainant's argument.

Assuming arguendo that Complainant had met his burden in establishing that the operation of the crane with the defective light load dog, under Respondent's work practice involving its use and processing of the CRANE OPERATOR DAILY CHECKLIST, amounted to a recognized hazard, the Citation would nonetheless have to be vacated since the Respondent established that it was without knowledge of the condition, nor could it have known, and that the condition was caused solely by the isolated act of a trained employee contrary to well established work rules.

ALLEGED AFFIRMATIVE DEFENSE

Basically Respondent in defense to the Citation has alleged, as an affirmative defense, that it was by reason of an isolated instance of employee misconduct that the condition which gave rise to the citation existed. Viewing what is necessary for this defense to be successful the U.S. Court of Appeals for the Fifth Circuit in H. B. Zachry Co. v. OSHRC, 638 F. 2d 812, 1981, stated:

> In order to prevail in this defense, an employer must demonstrate that (i) all feasible steps were taken to avoid the occurrence of the hazard, General Dynamics v. OSHRC, 599 F. 2d 453, 464 (7 OSHC 1373, 1380) (5th Cir. 1977); Horne Plumbing and Heaing Co. v. OSHRC, 528 F. 2d at 571 (3 OSHC at 2065). This includes the training of employees as to the dangers and the supervision of the worksite, Horne, 528 F. 2d 564 at 569 (3 OSHC 2060, 2063). And (ii) the actions of the employee were a departure from a uniformly and effectively communicated and enforced work rule of which departure the employer had neither actual or constructive knowledge. See, e.g., General Dynamics, 599 F. 2d at 465 (7 OSHC 1373 at 1380); Ames Crane and Rental Services Inc. v. Dunlop, 532 F. 2d 123 (4 OSHC 1060) (8th Cir. 1976).

The record in this case established that those elements necessary for Respondent to prevail on this issue has been proven.

Work rules concerning the use of a checklist to discover defects in the operation of the crane, and the manner by which the defects were

expeditiously corrected, were uniformly and effectively communicated and followed by Respondent's employees. The crane operators, skilled well-trained workmen, by demonstrating the ability to operate the crane in accordance with specific operating and safety rules were qualified to hold the job of crane operator. On the day of the accident Respondent's established work practice concerning the reporting and correction of defects found on the crane was followed by crane operator Johnson. As discussed earlier, he notified his supervisor of a swing brake deficiency on the crane. The supervisor in turn dispatched a workman to repair that defect as well as any other defects brought to his attention. The workman arrived prior to placing the crane in use to lift personnel.

Unfortunately, it was crane operator Johnson who did not fully use the work rule when he failed to report to his supervisor the fact of the inoperative light line winch dog (Tr. 343, 344, 351, 359, 524). He again failed to fully use the work practice by not informing the repairman who reported to the crane to repair the swing brake of the defect in the dog (Tr. 609, 610, 613). The crane operator persisted in operating the crane with the defective dog notwithstanding an immediate and readily available means for repair of the inoperative dog that had been provided to him by Respondent. This blatent departure by the crane operator from a well established and effective work practice designed to correct defects in the crane was one the employer could neither actually nor constructively anticipate.

While Complainant points out that the dog had repeatedly been reported as defective for some time prior to the incident, the credible evidence established that the continuing problem with the dog involved a minor matter dealing with the dog skipping a tooth on the winch drum ratchet when it was

engaged. At times it was found that the dog would not engage the first one or two teeth of the ratchet but would, upon jogging the winch, safely engage it as designed. This in no manner diminished the operation of the dog but was merely a problem which chronically persisted on the cranes, notwithstanding continual adjustment to the dog (Tr. 550, 552, 553, 556, 557). Once engaged the dog was fully operative performing its safety functions. The dog on Gantry Crane No. 15 was operative until someone unknown to any party in these proceedings surreptitiously placed a nut on the shaft handle preventing it from being engaged, a condition no one reasonably could have known of or anticipated (Tr. 354, 365, 367, 504, 522, 534, 554, 556, 562, 563, 611, 612, 614, 615).

On the date of the accident had the crane operator merely mentioned to the repairman that the dog was inoperative, a simple one minute repair involving the removal of the nut would have placed the dog back into full operation and the cited condition would never have existed. It was solely the unanticipated and unforeseeable act of the crane operator who specifically violated Respondent's well established work rule that allowed the crane to be operated with the defective dog on the date of the accident. The evidence established that Respondent was essentially without any opportunity to have instituted preventive or corrective measures. Respondent having established a valid affirmative defense, the Citation accordingly must be vacated.

## FINDINGS OF FACT

1. This is an action brought by the Secretary of Labor, United States Department of Labor, pursuant to the provisions of Section 10(c) of the Occupational Safety and Health Act of 1970. 29 U.S.C. Section 651, *et seq*.

2. As a result of a safety and health inspection held May 5, 1980, through June 13, 1980, Respondent was issued Citations on June 25, 1980, for serious and non-serious violations of regulations promulgated pursuant to the Act and for serious violations of the general duty clause. The Citations proposed a total penalty of $5,200.00 pursuant to Sections 10(a) and 17(k) of the Act.

3. Respondent timely filed its Notice of Contest.

4. Respondent in its answer filed September 26, 1980, admitted that the Occupational Safety and Health Review Commission has jurisdiction of the proceedings, that Respondent is an employer engaged in a business affecting commerce and has employees within the meaning of Section 3(5) of the Act, that the inspection was conducted by an authorized representative of the Complainant pursuant to Section 9(a) of the Act, and that the Citations which were attached to the Complaint were issued.

5. Joint Exhibit No. 1 disposes of all issues before the Commission for Items 2 and 6 of Citation No. 1 issued June 25, 1980 and Item 1 of Citation No. 2 issued June 25, 1980.

6. On February 27, 1980, during hearing, the parties entered into an agreement disposing of all issues before the Commission for Item 4 of Citation No. 1 and Item 2 of Citation No. 2.

7. On June 22, 1981, the written settlement agreement setting out the terms of the stipulations and agreements was agreed to by counsel for the respective parties and was served upon unrepresented affected employees by service of the fully executed Settlement Agreement on each authorized employee representative.

8. Respondent is engaged in the business of shipbuilding, ship repair and the construction of oil rigs at its worksite located at 850 Pine Street, Beaumont, Texas.

9. Each of Respondent's Crane Operators is required, at the start of each shift, to fill out a Crane Operator Daily Checklist which constitutes a written safety rule with respect to the inspection and operation of Respondent's cranes. The top of the checklist contains the name, badge number, crane number, date and shift. The remainder of the checklist reads as follows:

> "Check the following items at the start of each shift for each crane operated. If any RED item is faulty DO NOT OPERATE CRANE but notify your supervisor immediately. ALL FAULTS MUST BE CHECKED BY SUPERVISOR AND reported to maintenance as soon as possible but never later than end of shift."

The following items were marked in red on the checklist and were to be checked as "OK" or "Faulty" by Respondent's Crane Operators: (1) LIMIT SWITCHES: (20 BRAKES; (3) CONTROL LEVERS AND DOGS: (4) AIR PRESSURE: (5) HYDRAULIC SYSTEM: (6) OUT RIGGERS OPERABLE: (7) ENGINE LUBRICANT: (8) STEERING: (9) RADIATOR & PUMP: (10) EMERGENCY STOP SWITCHES (Complainant's Exhibit 25, Tr. 4361).

10. When Items Nos. 1 through 10 on the checklist are faulty, the Crane Operators are not to operate the crane but immediately notify the Maintenance Department and a maintenance man reports to the crane within 20 minutes and makes the necessary repairs (Tr. 348, 362, 438, 471, 488, 489, 498).

11. Respondent does not rely on receipt of the checklist prior to making any necessary repairs on the cranes; rather, Respondent relies on the Crane Operator's immediate oral communication of the malfunction on the crane to their supervisors who in turn promptly notify the Maintenance Department supervisors who immediately dispatch a maintenance man to the crane (Tr. 349, 444, 490, 512).

12. The collection of the checklist is a ministerial function to keep track of the repairs that are made on the crane.

13. The practice of requiring the crane operator to immediately notify his supervisor of needed repairs and having the maintenance department make the repairs immediately is an effective method to obtain the inspection and repair of defects to the crane.

14. The work rule referred to in Findings of Fact 9 through 13, has been adequately communicated to all of Respondent's Crane Operators, their supervisors and members of the maintenance department.

15. Whenever any crane including Gantry Crane No. 15 was faulty, especially with respect to Items Nos. 1-10 (under which defective dogs were reported) on the checklist, the Crane Operators immediately notified Respondent's supervisors who in turn immediately notified the maintenance department who sent a maintenance man to make the necessary repairs (Tr. 436, 440, 447).

16. The light load dog on Gantry Crane No. 15 was not faulty or defective. The problem with the dog noted by the Crane Operators involved the light load dog not being able to immediately engage the first tooth of the ratchet of the drum in every instance; it would engage in the second tooth when the drum was rotated. This was not unsafe since once engaged it remained so (Tr. 550, 552, 553, 556, 557).

17. On April 10, 1980, the light load dog was rendered inoperative by an unknown person who placed a nut on the dog's sliding shaft handle extending from the panel, causing the light load dog not to engage the teeth on the light load hoist drum. The Crane Operator determined at the start of the shift that the light load dog was not operating but, in violation of

Respondent's safety rule as noted on the checklist, failed to notify his supervisor and the maintenance man dispatched to the crane to repair the swing brake (Tr. 343, 344, 349, 351, 479, 524, 609, 610, 613).

18. Neither Respondent nor its supervisors were aware of the nut on the shaft on April 10, 1980, or on the previous single occasion when a nut was placed on the sliding shaft attached to the light load dog. Respondent learned of these two incidents after an accident occurring on April 10, 1980 (Tr. 354, 365, 367, 504, 522, 534, 554, 556, 562, 563, 611, 612, 614, 615).

19. On April 10, 1980, Crane No. 15 was used to lift and suspend a platform containing men who were to paint the sides of a ship.

20. The suspended platform, on which the painter was working prior to the accident, was constantly being raised and lowered and remained at each new position for very short periods (Tr. 381). While being lowered, the platform fell a number of feet to the ground injurying the men who were on it.

21. When the crane was inspected immediately after the platform had fallen, the nut on the dog's shaft was found. It was then removed and the crane worked properly without any additional repairs to the light load dog, the brakes, or any other item listed on the checklist. The light load brake and the friction brake, when tested immediately after the accident, stopped the falling gangway immediately - there was no malfunction with respect to either braking system.

22. The proper procedure to stop a falling load, gangplank, is to apply the foot brake, or friction brake. The dog was not designed to stop a falling load, nor could it do so (Tr. 361, 362).

## CONCLUSIONS OF LAW

1. Jurisdiction of the parties and the subject matter herein is confirmed upon the Occupational Safety and Health Review Commission by Section 19(c) of the Act.

2. At all times relevant hereto Respondent was an employer engaged in a business affecting interstate commerce, within the meaning of Section 3(5) of the Act, and as such it was subject to the requirements of Section 5(a)(1) and 5(a)(2) of the Act and the safety standards promulgated by the Complainant.

3. Complainant's motion to withdrawn Citation No. 1, Item 2 alleging a violation of Section 5(a)(1) of the Act and Citation No. 1, Item 5 alleging a violation of 29 C.F.R. Section 1916.51(a) is granted.

4. Complainant's amendment of the characterization of Item 6 of Citation No. 1 issued June 25, 1981 and Item 5 of Citation No. 2 issued June 25, 1980 to de minimis is approved.

5. The reduction of the proposed penalty in Item 4 of Citation No. 1 issued June 25, 1980, to $450.00 is approved and hereby assessed.

6. Respondent did not violate Section 5(a)(1) of the Act as charged by Complainant in Citation No. 1, Item No. 2. 4/

7. Respondent did not violate Section 5(a)(1) of the Act as charged by Complainant in Citation No. 1, Item No. 3.

8. Respondent violated Section 5(a)(2) of the Act by its failure to comply with the safety standards promulgated by Complainant and codified at 29 C.F.R. 1916.47(b) as charged in Citation No. 1, Item Nos. 4(a) and 4(b).

---

4/ The parties entered into a formal settlement agreement in respect of Citation No. 1, Items Nos. 2, 4, 5, and 6 and Citation No. 2, Items Nos. 1 and 2.

9. Respondent did not violate Section 5(a)(2) of the Act as charged by Complainant in Citation No. 1, Item No. 5.

10. Respondent violated Section 5(a)(2) of the Act by its failure to comply with the safety standards promulgated by Complainant and codified at 29 C.F.R. 1910.309(a) as charged in Citation No. 1, Item No. 6.

11. The Complainant failed to establish that a recognized hazard existed at Respondent's workplace by reason of the manner in which Crane No. 15 was operated on April 11, 1980. K-Mart, 1982 CCH OSHD para. _____; Jones & Laughlin Steel Corp., 1982 CCH OSHD para. 26,128, 10 BNA OSHC 1778; Brown & Root, Inc., 1980 CCH OSHD para. 24,853; United States Steel Corp., 1982 CCH OSHD para. 26,123, 10 OSHC 1752; Pratt & Witney, 1980 CCH OSHD para. 24,447; SSC Corp, 1976-77 CCH OSHD para. 20,814; Baroid Division of NL Industries, Inc. v. OSHRC, 660 F. 2d 439 (10th Cir. 1981); Whirlpool Corp. v. OSHRC, 645 F. 2d 1096 (D.C. Cir. 1981); Pratt & Whitney Aircraft v. Secretary of Labor, 649 F. 2d 96 (2nd Cir. 1981); Usery v. Marquette Cement Manufacturing Co., 568 F. 2d 902 (2nd Cir. 1977); National Realty and Construction Co. v. OSHRC, 489 F. 2d 1257 (D.C. Cir. 1973).

12. The operation of Crane No. 15 with a defective light line dog was unknown to Respondent and could not have been foreseen or reasonably prevented precluding the existence of a violation of the general duty clause. Prestressed Systems, Inc., 9 BNA OSHC 1864, 1981 CCH OSHD para. 25,358; General Electric Co., 9 BNA, OSHC 1722, 1981 CCH OSHD para. 25,345. The operation of Crane No. 15 with a defective dog was solely caused by reason of the misconduct of the crane operator, was an isolated act by an employee which the Respondent could not have foreseen or reasonably prevented, and thus not chargable to Respondent. H. B. Zachry Co. v. OSHRC, 638 F. 2d 812 (C.A. 5, 1981).

13. Respondent did not violate Section 5(a)(1) of the Act as charged by Complainant in Citation No. 1, Item No. 1.

## ORDER

Based upon the foregoing reasons as set out in my Decision and Order, and for good cause shown, it is ORDERED that:

1. Serious Citation No. 1, Item 1 is hereby VACATED.

2. The Partial Settlement Agreement, which has been posted in accordance with Rules 7 and 100 of the Commission Rules of Procedure, is approved. No objection has been filed by or on behalf of affected employees. It is therefore ORDERED that the Citations and proposed penalties as modified or amended by said Partial Settlement Agreement are AFFIRMED. Those Citations which have been withdrawn by the Complainant under terms of the Settlement Agreement, are hereby VACATED.

3. It is further ORDERED that the terms, conditions and stipulations contained within said Partial Settlement Agreement shall be adopted and incorporated herein as part of the final order of the Commission.

Edward A. Bobrick
Judge, OSHRC

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

---

RAYMOND J. DONOVAN, SECRETARY OF LABOR,

Complainant,

v.

OSHRC DOCKET
NO. 80-2973

NORFOLK SHIPBUILDING & DRYDOCK CORPORATION,

Respondent.

---

STIPULATION AND SETTLEMENT AGREEMENT

I.

The parties have reached a full and complete settlement of the instant matter which is presently pending before the Commission on review.

II.

The parties stipulate as follows:

(a) The Occupational Safety and Health Review Commission (hereinafter the Commission), has jurisdiction of this matter pursuant to section 10(c) of the Occupational Safety and Health Act of 1970 (29 U.S.C. §651 et seq.)

(b) Respondent, Norfolk Shipbuilding & Drydock Corporation, is a corporation with its principal place of business at Liberty Street, Norfolk, Virginia. Respondent is and was during all times during this proceeding an employer affecting commerce within the meaning of sections 3(3) and 3(5) of the Act and employed employees within the meaning of section 3(6) of the Act.

(c) As a result of an inspection conducted between February 22 and 28, 1980, there issued on May 6, 1980 a citation alleging violations of the OSH Act. Respondent timely contested these citations. All of the contested matters were resolved except for citation item 1(a) and 1(b) which were affirmed, but modified to reflect "other-than-serious" violations by Commission Judge Benjamin Usher. Respondent petitioned for review of the judge's decision and its petition was granted on November 23, 1981.

III.

(a) Complainant agrees to withdraw citations 1(a) and 1(b) which are before the Commission on review.

(b) Complainant reaffirms, as stated at pages 5 and 6 of the transcript in this proceeding, that adherence to the following procedure renders de minimis Respondent's failure to have separate lockers for employees engaged in asbestos insulation rip-out or removal as charged in citation 2 item (c):

> 1. Employees will remove and dispose of their coveralls in a change area prior to removing their respirators.
>
> 2. Prior to removing their coveralls employees will vacuum their coveralls.
>
> 3. After removing and disposing of their coveralls, employees will vacuum the clothing worn underneath the coveralls.
>
> 4. After vacuuming their street clothing, employees will remove their respirators and leave the change area.

Complainant agrees that continuation of these procedures is deemed as acceptable to OSHA in lieu of the provision of separate lockers for employees' street clothes and disposable coveralls and that Complainant will not cite Respondent for violation of 29 CFR 1910.1001(d)(4)(ii) if Respondent continues to insure that its employees follow these procedures in a manner sufficient to prevent employees from leaving their workplace with asbestos fibers on their clothing.

(c) Respondent agrees to continue the following abatement procedures when performing asbestos removal or rip-out operations, as specified in its stipulation with respect to Citation 1, item (c), and Citation 2, item (a) (transcript 5-6):

> 1. Employees will cut insulation material from pipes only after adequately wetting the point of contact and will adequately wet the area again after removing the outer wrapping of the insulation.
>
> 2. Respondent also agrees that when insulation removal or rip-out operations are performed it will isolate the work area with plastic from other areas in which employees are present.
>
> 3. Employees will continue to wear full suit disposable coveralls when working in an area in which insulation rip-out or removal operations are being performed.
>
> 4. Employees will wear respiratory equipment which adequately protects them from the asbestos levels present in the work area.

5. Employees will wear rubber gloves taped to their coveralls.

6. Employees will wear appropriate protective goggles over their eyes.

7. Employees will continue to be provided with pre-employment and annual physical examinations as set forth in 29 CFR 1910.1001(j).

Complainant agrees that continuation of these procedures is deemed acceptable to OSHA under the present state of technology in lieu of the provisions of 29 CFR 1910.1001(c)(1)(i) and (iii) (except when the use of a glove box is feasible) and that Complainant will not cite Respondent for violations of these sections if Respondent continues to insure that its employees follow these procedures; unless, there is a technological advance after the date of this agreement which makes it technically feasible to control the dispersion of asbestos fibers at its source during insulation rip-out or removal operations and/or unless Complainant believes that use of a glove box is feasible to control the dispersion of asbestos fibers at its source.

IV.

The parties agree that each party will bear its own costs and attorney's fees.

V.

Respondent will post the instant Stipulation and Settlement Agreement in accordance with Rule 7 of the Rules of Procedure of the Commission.

WHEREFORE, the parties respectfully request that this stipulation and settlement agreement be approved by the Commission.

FOR THE COMPLAINANT

FOR THE RESPONDENT

## NOTICE OF DOCKETING

Notice is given that the above case was docketed with the Commission on November 30, 1982. The decision of the Judge will become a final order of the Commission on December 30, 1982 unless a Commission member directs review of the decision on or before that date.

Petitions for discretionary review should be received early in order to permit sufficient time for their review. See Commission Rule 91, 29 C.F.R. Sec. 2200.91.

All pleadings or other documents that may be filed shall be addressed as follows:

## ORDER ON REMAND

The Commission, by order dated Sepember 30, 1982, set aside the judge's order of August 18, 1982, and remanded the case for consideration of the "union's apparent opjections and for any further proceedings that may be appropriate." The union had indicated that it objected to the respondent's withdrawing its notice of contest.

A hearing was scheduled in this matter for November 8, 1982, in accordance with the Commission's order of remand. On October 29, 1982, a letter was received from William D. Crawford, General Vice President and National Legislative Representative of the Brotherhood Railway Carmen of the United States and Canada, wherein he stated that the union "hereby withdraws any objections it has to Respondent's Withdrawal of its Notice of Contest in the above captioned matter." Accordingly, it is

ORDERED: 1. That respondent's motion to withdraw its notice of contest which was received on August 16, 1982, is granted; and

2. That the "other" citation issued to respondent on April 1, 1982, is affirmed.

Dated this 22nd day of November, 1982.
